All Rights Reserved.

### **Attention please!**

As far as patents or other rights of third parties are concerned, liability is only assumed for components, not for applications, processes and circuits implemented within components or assemblies.

The information describes the type of component and shall not be considered as assured characteristics.

Terms of delivery and rights to change design reserved.

For questions on technology, delivery and prices please contact the Semiconductor Group Offices in Germany or the Siemens Companies and Representatives worldwide (see address list).

Due to technical requirements components may contain dangerous substances. For information on the types in question please contact your nearest Siemens Office, Semiconductor Group.

Siemens AG is an approved CECC manufacturer.

### **Packing**

Please use the recycling operators known to you. We can also help you – get in touch with your nearest sales office. By agreement we will take packing material back, if it is sorted. You must bear the costs of transport.

For packing material that is returned to us unsorted or which we are not obliged to accept, we shall have to invoice you for any costs incurred.

### **Components used in life-support devices or systems must be expressly authorized for such purpose!**

Critical components<sup>1</sup> of the Semiconductor Group of Siemens AG, may only be used in life-support devices or systems<sup>2</sup> with the express written approval of the Semiconductor Group of Siemens AG.

- 1 A critical component is a component used in a life-support device or system whose failure can reasonably be expected to cause the failure of that life-support device or system, or to affect its safety or effectiveness of that device or system.
- 2 Life support devices or systems are intended (a) to be implanted in the human body, or (b) to support and/or maintain and sustain human life. If they fail, it is reasonable to assume that the health of the user may be endangered.

## 1 Introduction

The Siemens family of 16-bit microcontrollers offers devices that provide various levels of peripheral performance and programmability. This allows to equip each specific application with the microcontroller that fits best to the required functionality and performance.

Still the Siemens family concept provides an easy path to upgrade existing applications or to climb the next level of performance in order to realize a subsequent more sophisticated design. Two major characteristics enable this upgrade path to save and reuse almost all of the engineering efforts that have been made for previous designs:

- All family members are based on the same basic architecture
- All family members execute the same instructions (except for upgrades for new members)

The fact that all members execute the same instructions (almost) saves knowhow with respect to the understanding of the controller itself and also with respect to the used tools (assembler, disassembler, compiler, etc.).

This instruction set manual provides an easy and direct access to the instructions of the Siemens 16-bit microcontrollers by listing them according to different criteria, and also unloads the technical manuals for the different devices from redundant information.

This manual also describes the different addressing mechanisms and the relation between the logical addresses used in a program and the resulting physical addresses.

There is also information provided to calculate the execution time for specific instructions depending on the used address locations and also specific exceptions to the standard rules.

### Description Levels

In the following sections the instructions are compiled according to different criteria in order to provide different levels of precision:

- **Cross Reference Tables** summarize all instructions in condensed tables
- **The Instruction Set Summary** groups the individual instructions into functional groups
- **The Opcode Table** references the instructions by their hexadecimal opcode
- **The Instruction Description** describes each instruction in full detail

All instructions listed in this manual are executed by the following devices (new derivatives will be added to this list):

C161V, C161K, C161O, C161RI, C161SI, C161CI, C163, C163F, C164CI, C165, C167, C167CR, C167SR, C167S, C167CS.

A few instructions (ATOMIC and EXTended instructions) have been added for these devices and are not recognized by the following devices:

SAB 80C166, SAB 80C166W, SAB 83C166, SAB 83C166W, SAB 88C166, SAB 88C166W.

These differences are noted for each instruction, where applicable.

### 2 Short Instruction Summary

The following compressed cross-reference tables quickly identify a specific instruction and provide basic information about it. Two ordering schemes are included:

The first table (two pages) is a compressed cross-reference table that quickly identifies a specific hexadecimal opcode with the respective mnemonic.

The second table lists the instructions by their mnemonic and identifies the addressing modes that may be used with a specific instruction and the instruction length depending on the selected addressing mode. This reference helps to optimize instruction sequences in terms of code size and/or execution time.

•	0x	1x	2x	3x	4x	5x	6x	7x

1) Byte oriented instructions (suffix 'B') use Rb instead of Rw (not with [Rwn]!).

2) Byte oriented instructions (suffix 'B') use #data8 instead of #data16.

3) The ATOMIC and EXTENDED instructions are not available in the SAB 8XC166(W) devices.

### 3 Instruction Set Summary

This chapter summarizes the instructions by listing them according to their functional class. This allows to identify the right instruction(s) for a specific required function.

The following notes apply to this summary:

#### Data Addressing Modes

- Rw: – Word GPR (R0, R1, ... , R15)
- Rb: – Byte GPR (RL0, RH0, ..., RL7, RH7)
- reg: – SFR or GPR  
(in case of a byte operation on an SFR, only the low byte can be accessed via 'reg')
- mem: – Direct word or byte memory location
- [...]: – Indirect word or byte memory location  
(Any word GPR can be used as indirect address pointer, except for the arithmetic, logical and compare instructions, where only R0 to R3 are allowed)
- bitaddr: – Direct bit in the bit-addressable memory area
- bitoff: – Direct word in the bit-addressable memory area
- #data: – Immediate constant  
(The number of significant bits which can be specified by the user is represented by the respective appendix 'x')
- #mask8: – Immediate 8-bit mask used for bit-field modifications

#### Multiply and Divide Operations

The MDL and MDH registers are implicit source and/or destination operands of the multiply and divide instructions.

#### Branch Target Addressing Modes

- caddr: – Direct 16-bit jump target address (Updates the Instruction Pointer)
- seg: – Direct 2-bit segment address  
(Updates the Code Segment Pointer)
- rel: – Signed 8-bit jump target word offset address relative to the Instruction Pointer of the following instruction
- #trap7: – Immediate 7-bit trap or interrupt number.

### Extension Operations

The EXT\* instructions override the standard DPP addressing scheme:

- #pag10: – Immediate 10-bit page address.
- #seg8: – Immediate 8-bit segment address.

**Note:** The EXTended instructions are not available in the SAB 8XC166(W) devices.

### Branch Condition Codes

cc:	Symbolically specifiable condition codes
cc_UC	– Unconditional
cc_Z	– Zero
cc_NZ	– Not Zero
cc_V	– Overflow
cc_NV	– No Overflow
cc_N	– Negative
cc_NN	– Not Negative
cc_C	– Carry
cc_NC	– No Carry
cc_EQ	– Equal
cc_NE	– Not Equal
cc_ULT	– Unsigned Less Than
cc_ULE	– Unsigned Less Than or Equal
cc_UGE	– Unsigned Greater Than or Equal
cc_UGT	– Unsigned Greater Than
cc_SLE	– Signed Less Than or Equal
cc_SGE	– Signed Greater Than or Equal
cc_SGT	– Signed Greater Than
cc_NET	– Not Equal and Not End-of-Table

### Instruction Set Summary

Mnemonic	Description	Bytes
<b>Arithmetic Operations</b>		
ADD Rw, Rw	Add direct word GPR to direct GPR	2
ADD Rw, [Rw]	Add indirect word memory to direct GPR	2
ADD Rw, [Rw +]	Add indirect word memory to direct GPR and post-increment source pointer by 2	2
ADD Rw, #data3	Add immediate word data to direct GPR	2
ADD reg, #data16	Add immediate word data to direct register	4
ADD reg, mem	Add direct word memory to direct register	4
ADD mem, reg	Add direct word register to direct memory	4
ADDB Rb, Rb	Add direct byte GPR to direct GPR	2
ADDB Rb, [Rw]	Add indirect byte memory to direct GPR	2
ADDB Rb, [Rw +]	Add indirect byte memory to direct GPR and post-increment source pointer by 1	2
ADDB Rb, #data3	Add immediate byte data to direct GPR	2
ADDB reg, #data8	Add immediate byte data to direct register	4
ADDB reg, mem	Add direct byte memory to direct register	4
ADDB mem, reg	Add direct byte register to direct memory	4
ADDC Rw, Rw	Add direct word GPR to direct GPR with Carry	2
ADDC Rw, [Rw]	Add indirect word memory to direct GPR with Carry	2
ADDC Rw, [Rw +]	Add indirect word memory to direct GPR with Carry and post-increment source pointer by 2	2
ADDC Rw, #data3	Add immediate word data to direct GPR with Carry	2
ADDC reg, #data16	Add immediate word data to direct register with Carry	4
ADDC reg, mem	Add direct word memory to direct register with Carry	4
ADDC mem, reg	Add direct word register to direct memory with Carry	4
ADDCB Rb, Rb	Add direct byte GPR to direct GPR with Carry	2
ADDCB Rb, [Rw]	Add indirect byte memory to direct GPR with Carry	2
ADDCB Rb, [Rw +]	Add indirect byte memory to direct GPR with Carry and post-increment source pointer by 1	2
ADDCB Rb, #data3	Add immediate byte data to direct GPR with Carry	2
ADDCB reg, #data8	Add immediate byte data to direct register with Carry	4
ADDCB reg, mem	Add direct byte memory to direct register with Carry	4

### Instruction Set Summary (cont'd)\*

Mnemonic	Description	Bytes
----------	-------------	-------

### Arithmetic Operations (cont'd)

ADDCB	mem, reg	Add direct byte register to direct memory with Carry	4
SUB	Rw, Rw	Subtract direct word GPR from direct GPR	2
SUB	Rw, [Rw]	Subtract indirect word memory from direct GPR	2
SUB	Rw, [Rw +]	Subtract indirect word memory from direct GPR and post-increment source pointer by 2	2
SUB	Rw, #data3	Subtract immediate word data from direct GPR	2
SUB	reg, #data16	Subtract immediate word data from direct register	4
SUB	reg, mem	Subtract direct word memory from direct register	4
SUB	mem, reg	Subtract direct word register from direct memory	4
SUBB	Rb, Rb	Subtract direct byte GPR from direct GPR	2
SUBB	Rb, [Rw]	Subtract indirect byte memory from direct GPR	2
SUBB	Rb, [Rw +]	Subtract indirect byte memory from direct GPR and post-increment source pointer by 1	2
SUBB	Rb, #data3	Subtract immediate byte data from direct GPR	2
SUBB	reg, #data8	Subtract immediate byte data from direct register	4
SUBB	reg, mem	Subtract direct byte memory from direct register	4
SUBB	mem, reg	Subtract direct byte register from direct memory	4
SUBC	Rw, Rw	Subtract direct word GPR from direct GPR with Carry	2
SUBC	Rw, [Rw]	Subtract indirect word memory from direct GPR with Carry	2
SUBC	Rw, [Rw +]	Subtract indirect word memory from direct GPR with Carry and post-increment source pointer by 2	2
SUBC	Rw, #data3	Subtract immediate word data from direct GPR with Carry	2
SUBC	reg, #data16	Subtract immediate word data from direct register with Carry	4
SUBC	reg, mem	Subtract direct word memory from direct register with Carry	4
SUBC	mem, reg	Subtract direct word register from direct memory with Carry	4
SUBCB	Rb, Rb	Subtract direct byte GPR from direct GPR with Carry	2
SUBCB	Rb, [Rw]	Subtract indirect byte memory from direct GPR with Carry	2
SUBCB	Rb, [Rw +]	Subtract indirect byte memory from direct GPR with Carry and post-increment source pointer by 1	2
SUBCB	Rb, #data3	Subtract immediate byte data from direct GPR with Carry	2
SUBCB	reg, #data8	Subtract immediate byte data from direct register with Carry	4

### Instruction Set Summary (cont'd)\*

Mnemonic	Description	Bytes
----------	-------------	-------

### Arithmetic Operations (cont'd)

SUBCB	reg, mem	Subtract direct byte memory from direct register with Carry	4
SUBCB	mem, reg	Subtract direct byte register from direct memory with Carry	4
MUL	Rw, Rw	Signed multiply direct GPR by direct GPR (16-16-bit)	2
MULU	Rw, Rw	Unsigned multiply direct GPR by direct GPR (16-16-bit)	2
DIV	Rw	Signed divide register MDL by direct GPR (16-/16-bit)	2
DIVL	Rw	Signed long divide register MD by direct GPR (32-/16-bit)	2
DIVLU	Rw	Unsigned long divide register MD by direct GPR (32-/16-bit)	2
DIVU	Rw	Unsigned divide register MDL by direct GPR (16-/16-bit)	2
CPL	Rw	Complement direct word GPR	2
CPLB	Rb	Complement direct byte GPR	2
NEG	Rw	Negate direct word GPR	2
NEGB	Rb	Negate direct byte GPR	2

### Logical Instructions

AND	Rw, Rw	Bitwise AND direct word GPR with direct GPR	2
AND	Rw, [Rw]	Bitwise AND indirect word memory with direct GPR	2
AND	Rw, [Rw +]	Bitwise AND indirect word memory with direct GPR and post-increment source pointer by 2	2
AND	Rw, #data3	Bitwise AND immediate word data with direct GPR	2
AND	reg, #data16	Bitwise AND immediate word data with direct register	4
AND	reg, mem	Bitwise AND direct word memory with direct register	4
AND	mem, reg	Bitwise AND direct word register with direct memory	4
ANDB	Rb, Rb	Bitwise AND direct byte GPR with direct GPR	2
ANDB	Rb, [Rw]	Bitwise AND indirect byte memory with direct GPR	2
ANDB	Rb, [Rw +]	Bitwise AND indirect byte memory with direct GPR and post-increment source pointer by 1	2
ANDB	Rb, #data3	Bitwise AND immediate byte data with direct GPR	2
ANDB	reg, #data8	Bitwise AND immediate byte data with direct register	4
ANDB	reg, mem	Bitwise AND direct byte memory with direct register	4
ANDB	mem, reg	Bitwise AND direct byte register with direct memory	4

### Instruction Set Summary (cont'd)\*

Mnemonic	Description	Bytes	
<b>Logical Instructions (cont'd)</b>			
OR	Rw, Rw	Bitwise OR direct word GPR with direct GPR	2
OR	Rw, [Rw]	Bitwise OR indirect word memory with direct GPR	2
OR	Rw, [Rw +]	Bitwise OR indirect word memory with direct GPR and post-increment source pointer by 2	2
OR	Rw, #data3	Bitwise OR immediate word data with direct GPR	2
OR	reg, #data16	Bitwise OR immediate word data with direct register	4
OR	reg, mem	Bitwise OR direct word memory with direct register	4
OR	mem, reg	Bitwise OR direct word register with direct memory	4
ORB	Rb, Rb	Bitwise OR direct byte GPR with direct GPR	2
ORB	Rb, [Rw]	Bitwise OR indirect byte memory with direct GPR	2
ORB	Rb, [Rw +]	Bitwise OR indirect byte memory with direct GPR and post-increment source pointer by 1	2
ORB	Rb, #data3	Bitwise OR immediate byte data with direct GPR	2
ORB	reg, #data8	Bitwise OR immediate byte data with direct register	4
ORB	reg, mem	Bitwise OR direct byte memory with direct register	4
ORB	mem, reg	Bitwise OR direct byte register with direct memory	4
XOR	Rw, Rw	Bitwise XOR direct word GPR with direct GPR	2
XOR	Rw, [Rw]	Bitwise XOR indirect word memory with direct GPR	2
XOR	Rw, [Rw +]	Bitwise XOR indirect word memory with direct GPR and post-increment source pointer by 2	2
XOR	Rw, #data3	Bitwise XOR immediate word data with direct GPR	2
XOR	reg, #data16	Bitwise XOR immediate word data with direct register	4
XOR	reg, mem	Bitwise XOR direct word memory with direct register	4
XOR	mem, reg	Bitwise XOR direct word register with direct memory	4
XORB	Rb, Rb	Bitwise XOR direct byte GPR with direct GPR	2
XORB	Rb, [Rw]	Bitwise XOR indirect byte memory with direct GPR	2
XORB	Rb, [Rw +]	Bitwise XOR indirect byte memory with direct GPR and post-increment source pointer by 1	2
XORB	Rb, #data3	Bitwise XOR immediate byte data with direct GPR	2
XORB	reg, #data8	Bitwise XOR immediate byte data with direct register	4
XORB	reg, mem	Bitwise XOR direct byte memory with direct register	4
XORB	mem, reg	Bitwise XOR direct byte register with direct memory	4

### Instruction Set Summary (cont'd)\*

Mnemonic	Description	Bytes
----------	-------------	-------

#### Boolean Bit Manipulation Operations

BCLR	bitaddr	Clear direct bit	2
BSET	bitaddr	Set direct bit	2
BMOV	bitaddr, bitaddr	Move direct bit to direct bit	4
BMOVN	bitaddr, bitaddr	Move negated direct bit to direct bit	4
BAND	bitaddr, bitaddr	AND direct bit with direct bit	4
BOR	bitaddr, bitaddr	OR direct bit with direct bit	4
BXOR	bitaddr, bitaddr	XOR direct bit with direct bit	4
BCMP	bitaddr, bitaddr	Compare direct bit to direct bit	4
BFLDH	bitoff, #mask8, #data8	Bitwise modify masked high byte of bit-addressable direct word memory with immediate data	4
BFLDL	bitoff, #mask8, #data8	Bitwise modify masked low byte of bit-addressable direct word memory with immediate data	4
CMP	Rw, Rw	Compare direct word GPR to direct GPR	2
CMP	Rw, [Rw]	Compare indirect word memory to direct GPR	2
CMP	Rw, [Rw +]	Compare indirect word memory to direct GPR and post-increment source pointer by 2	2
CMP	Rw, #data3	Compare immediate word data to direct GPR	2
CMP	reg, #data16	Compare immediate word data to direct register	4
CMP	reg, mem	Compare direct word memory to direct register	4
CMPB	Rb, Rb	Compare direct byte GPR to direct GPR	2
CMPB	Rb, [Rw]	Compare indirect byte memory to direct GPR	2
CMPB	Rb, [Rw +]	Compare indirect byte memory to direct GPR and post-increment source pointer by 1	2
CMPB	Rb, #data3	Compare immediate byte data to direct GPR	2
CMPB	reg, #data8	Compare immediate byte data to direct register	4
CMPB	reg, mem	Compare direct byte memory to direct register	4

#### Compare and Loop Control Instructions

CMPD1	Rw, #data4	Compare immediate word data to direct GPR and decrement GPR by 1	2
CMPD1	Rw, #data16	Compare immediate word data to direct GPR and decrement GPR by 1	4

### Instruction Set Summary (cont'd)\*

Mnemonic	Description	Bytes
----------	-------------	-------

#### Compare and Loop Control Instructions (cont'd)

CMPD1	Rw, mem	Compare direct word memory to direct GPR and decrement GPR by 1	4
CMPD2	Rw, #data4	Compare immediate word data to direct GPR and decrement GPR by 2	2
CMPD2	Rw, #data16	Compare immediate word data to direct GPR and decrement GPR by 2	4
CMPD2	Rw, mem	Compare direct word memory to direct GPR and decrement GPR by 2	4
CMPI1	Rw, #data4	Compare immediate word data to direct GPR and increment GPR by 1	2
CMPI1	Rw, #data16	Compare immediate word data to direct GPR and increment GPR by 1	4
CMPI1	Rw, mem	Compare direct word memory to direct GPR and increment GPR by 1	4
CMPI2	Rw, #data4	Compare immediate word data to direct GPR and increment GPR by 2	2
CMPI2	Rw, #data16	Compare immediate word data to direct GPR and increment GPR by 2	4
CMPI2	Rw, mem	Compare direct word memory to direct GPR and increment GPR by 2	4

#### Prioritize Instruction

PRIOR	Rw, Rw	Determine number of shift cycles to normalize direct word GPR and store result in direct word GPR	2
-------	--------	---	---

#### Shift and Rotate Instructions

SHL	Rw, Rw	Shift left direct word GPR; number of shift cycles specified by direct GPR	2
SHL	Rw, #data4	Shift left direct word GPR; number of shift cycles specified by immediate data	2
SHR	Rw, Rw	Shift right direct word GPR; number of shift cycles specified by direct GPR	2

### Instruction Set Summary (cont'd)\*

Mnemonic	Description	Bytes
----------	-------------	-------

### Shift and Rotate Instructions (cont'd)

SHR	Rw, #data4	Shift right direct word GPR; number of shift cycles specified by immediate data	2
ROL	Rw, Rw	Rotate left direct word GPR; number of shift cycles specified by direct GPR	2
ROL	Rw, #data4	Rotate left direct word GPR; number of shift cycles specified by immediate data	2
ROR	Rw, Rw	Rotate right direct word GPR; number of shift cycles specified by direct GPR	2
ROR	Rw, #data4	Rotate right direct word GPR; number of shift cycles specified by immediate data	2
ASHR	Rw, Rw	Arithmetic (sign bit) shift right direct word GPR; number of shift cycles specified by direct GPR	2
ASHR	Rw, #data4	Arithmetic (sign bit) shift right direct word GPR; number of shift cycles specified by immediate data	2

### Data Movement

MOV	Rw, Rw	Move direct word GPR to direct GPR	2
MOV	Rw, #data4	Move immediate word data to direct GPR	2
MOV	reg, #data16	Move immediate word data to direct register	4
MOV	Rw, [Rw]	Move indirect word memory to direct GPR	2
MOV	Rw, [Rw +]	Move indirect word memory to direct GPR and post-increment source pointer by 2	2
MOV	[Rw], Rw	Move direct word GPR to indirect memory	2
MOV	[-Rw], Rw	Pre-decrement destination pointer by 2 and move direct word GPR to indirect memory	2
MOV	[Rw], [Rw]	Move indirect word memory to indirect memory	2
MOV	[Rw +], [Rw]	Move indirect word memory to indirect memory and post-increment destination pointer by 2	2
MOV	[Rw], [Rw +]	Move indirect word memory to indirect memory and post-increment source pointer by 2	2
MOV	Rw, [Rw + #data16]	Move indirect word memory by base plus constant to direct GPR	4
MOV	[Rw + #data16], Rw	Move direct word GPR to indirect memory by base plus constant	4

### Instruction Set Summary (cont'd)\*

Mnemonic	Description	Bytes
<b>Data Movement (cont'd)</b>		
MOV [Rw], mem	Move direct word memory to indirect memory	4
MOV mem, [Rw]	Move indirect word memory to direct memory	4
MOV reg, mem	Move direct word memory to direct register	4
MOV mem, reg	Move direct word register to direct memory	4
MOVB Rb, Rb	Move direct byte GPR to direct GPR	2
MOVB Rb, #data4	Move immediate byte data to direct GPR	2
MOVB reg, #data8	Move immediate byte data to direct register	4
MOVB Rb, [Rw]	Move indirect byte memory to direct GPR	2
MOVB Rb, [Rw +]	Move indirect byte memory to direct GPR and post-increment source pointer by 1	2
MOVB [Rw], Rb	Move direct byte GPR to indirect memory	2
MOVB [-Rw], Rb	Pre-decrement destination pointer by 1 and move direct byte GPR to indirect memory	2
MOVB [Rw], [Rw]	Move indirect byte memory to indirect memory	2
MOVB [Rw +], [Rw]	Move indirect byte memory to indirect memory and post-increment destination pointer by 1	2
MOVB [Rw], [Rw +]	Move indirect byte memory to indirect memory and post-increment source pointer by 1	2
MOVB Rb, [Rw + #data16]	Move indirect byte memory by base plus constant to direct GPR	4
MOVB [Rw + #data16], Rb	Move direct byte GPR to indirect memory by base plus constant	4
MOVB [Rw], mem	Move direct byte memory to indirect memory	4
MOVB mem, [Rw]	Move indirect byte memory to direct memory	4
MOVB reg, mem	Move direct byte memory to direct register	4
MOVB mem, reg	Move direct byte register to direct memory	4
MOVBS Rb, Rb	Move direct byte GPR with sign extension to direct word GPR	2
MOVBS reg, mem	Move direct byte memory with sign extension to direct word register	4
MOVBS mem, reg	Move direct byte register with sign extension to direct word memory	4

### Instruction Set Summary (cont'd)\*

Mnemonic	Description	Bytes
<b>Data Movement (cont'd)</b>		
MOVBZ   Rw, Rb	Move direct byte GPR with zero extension to direct word GPR	2
MOVBZ   reg, mem	Move direct byte memory with zero extension to direct word register	4
MOVBZ   mem, reg	Move direct byte register with zero extension to direct word memory	4

### Jump and Call Operations

JMPA   cc, caddr	Jump absolute if condition is met	4
JMPI   cc, [Rw]	Jump indirect if condition is met	2
JMPR   cc, rel	Jump relative if condition is met	2
JMPS   seg, caddr	Jump absolute to a code segment	4
JB      bitaddr, rel	Jump relative if direct bit is set	4
JBC    bitaddr, rel	Jump relative and clear bit if direct bit is set	4
JNB    bitaddr, rel	Jump relative if direct bit is not set	4
JNBS   bitaddr, rel	Jump relative and set bit if direct bit is not set	4
CALLA   cc, caddr	Call absolute subroutine if condition is met	4
CALLI   cc, [Rw]	Call indirect subroutine if condition is met	2
CALLR   rel	Call relative subroutine	2
CALLS   seg, caddr	Call absolute subroutine in any code segment	4
PCALL   reg, caddr	Push direct word register onto system stack and call absolute subroutine	4
TRAP    #trap7	Call interrupt service routine via immediate trap number	2

### System Stack Operations

POP      reg	Pop direct word register from system stack	2
PUSH     reg	Push direct word register onto system stack	2
SCXT    reg, #data16	Push direct word register onto system stack und update register with immediate data	4
SCXT    reg, mem	Push direct word register onto system stack und update register with direct memory	4

### Instruction Set Summary (cont'd)\*

Mnemonic	Description	Bytes
----------	-------------	-------

#### Return Operations

RET	Return from intra-segment subroutine	2
RETS	Return from inter-segment subroutine	2
RETP reg	Return from intra-segment subroutine and pop direct word register from system stack	2
RETI	Return from interrupt service subroutine	2

#### System Control

SRST	Software Reset	4
IDLE	Enter Idle Mode	4
PWRDN	Enter Power Down Mode (supposes NMI-pin being low)	4
SRVWDT	Service Watchdog Timer	4
DISWDT	Disable Watchdog Timer	4
EINIT	Signify End-of-Initialization on RSTOUT-pin	4
ATOMIC #irang2	Begin ATOMIC sequence *)	2
EXTR #irang2	Begin EXTENDED Register sequence *)	2
EXTP Rw, #irang2	Begin EXTENDED Page sequence *)	2
EXTP #pag10, #irang2	Begin EXTENDED Page sequence *)	4
EXTPR Rw, #irang2	Begin EXTENDED Page and Register sequence *)	2
EXTPR #pag10, #irang2	Begin EXTENDED Page and Register sequence *)	4
EXTS Rw, #irang2	Begin EXTENDED Segment sequence *)	2
EXTS #seg8, #irang2	Begin EXTENDED Segment sequence *)	4
EXTSR Rw, #irang2	Begin EXTENDED Segment and Register sequence *)	2
EXTSR #seg8, #irang2	Begin EXTENDED Segment and Register sequence *)	4

#### Miscellaneous

NOP	Null operation	2
-----	----------------	---

\*) The EXTENDED instructions are not available in the SAB 8XC166(W) devices.

### 4 Instruction Opcodes

The following pages list the instructions of the 16-bit microcontrollers ordered by their hexadecimal opcodes. This helps to identify specific instructions when reading executable code, ie. during the debugging phase.

#### Notes for Opcode Lists

- 1) These instructions are encoded by means of additional bits in the operand field of the instruction

x0 <sub>H</sub> – x7 <sub>H</sub> :	Rw, #data3	or	Rb, #data3
x8 <sub>H</sub> – xB <sub>H</sub> :	Rw, [Rw]	or	Rb, [Rw]
xC <sub>H</sub> – xF <sub>H</sub> :	Rw, [Rw +]	or	Rb, [Rw +]

For these instructions only the lowest four GPRs, R0 to R3, can be used as indirect address pointers.

- 2) These instructions are encoded by means of additional bits in the operand field of the instruction

00xx.xxxx <sub>B</sub> :	EXTS	or	ATOMIC
01xx.xxxx <sub>B</sub> :	EXTP		
10xx.xxxx <sub>B</sub> :	EXTSR	or	EXTR
11xx.xxxx <sub>B</sub> :	EXTPR		

The ATOMIC and EXTended instructions are not available in the SAB 8XC166(W) devices.

#### Notes on the JMPR Instructions

The condition code to be tested for the JMPR instructions is specified by the opcode.

Two mnemonic representation alternatives exist for some of the condition codes.

#### Notes on the BCLR and BSET Instructions

The position of the bit to be set or to be cleared is specified by the opcode. The operand 'bitoff.n' (n = 0 to 15) refers to a particular bit within a bit-addressable word.

#### Notes on the Undefined Opcodes

A hardware trap occurs when one of the undefined opcodes signified by '----' is decoded by the CPU.

Hex-code	Number of Bytes	Mnemonic	Operands	Hex-code	Number of Bytes	Mnemonic	Operands
00	2	ADD	Rw, Rw	20	2	SUB	Rw, Rw

### 5 Instruction Description

This chapter describes each instruction in detail. The instructions are ordered alphabetically, and the description contains the following elements:

•**Instruction Name**• Specifies the mnemonic opcode of the instruction in oversized bold lettering for easy reference. The mnemonics have been chosen with regard to the particular operation which is performed by the specified instruction.

•**Syntax**• Specifies the mnemonic opcode and the required formal operands of the instruction as used in the following subsection 'Operation'. There are instructions with either none, one, two or three operands, which must be separated from each other by commas:

MNEMONIC {op1 {,op2 {,op3 } } }

The syntax for the actual operands of an instruction depends on the selected addressing mode. All of the addressing modes available are summarized at the end of each single instruction description. In contrast to the syntax for the instructions described in the following, the assembler provides much more flexibility in writing C166 Family programs (e.g. by generic instructions and by automatically selecting appropriate addressing modes whenever possible), and thus it eases the use of the instruction set. For more information about this item please refer to the Assembler manual.

•**Operation**• This part presents a logical description of the operation performed by an instruction by means of a symbolic formula or a high level language construct.

The following symbols are used to represent data movement, arithmetic or logical operators.

#### Diadic operations: (opX)

			operator (opY)
←	(opY)	is	<b>MOVED</b> into (opX)
+	(opX)	is	<b>ADDED</b> to (opY)
-	(opY)	is	<b>SUBTRACTED</b> from (opX)
*	(opX)	is	<b>MULTIPLIED</b> by (opY)
/	(opX)	is	<b>DIVIDED</b> by (opY)
∧	(opX)	is	logically <b>ANDed</b> with (opY)
∨	(opX)	is	logically <b>ORed</b> with (opY)
⊕	(opX)	is	logically <b>EXCLUSIVELY ORed</b> with (opY)
⇔	(opX)	is	<b>COMPARED</b> against (opY)
mod	(opX)	is	divided <b>MODULO</b> (opY)

#### Monadic operations:

			operator (opX)
¬	(opX)	is	logically <b>COMPLEMENTED</b>

Missing or existing parentheses signify whether the used operand specifies an immediate constant value, an address or a pointer to an address as follows:

opX	Specifies the immediate constant value of opX
(opX)	Specifies the contents of opX
(opX <sub>n</sub> )	Specifies the contents of bit n of opX
((opX))	Specifies the contents of the contents of opX (ie. opX is used as pointer to the actual operand)

The following operands will also be used in the operational description:

CP	Context Pointer register
CSP	Code Segment Pointer register
IP	Instruction Pointer
MD	Multiply/Divide register (32 bits wide, consists of MDH and MDL)
MDL, MDH	Multiply/Divide Low and High registers (each 16 bit wide )
PSW	Program Status Word register
SP	System Stack Pointer register
SYSCON	System Configuration register
C	Carry condition flag in the PSW register
V	Overflow condition flag in the PSW register
SGTDIS	Segmentation Disable bit in the SYSCON register
count	Temporary variable for an intermediate storage of the number of shift or rotate cycles which remain to complete the shift or rotate operation
tmp	Temporary variable for an intermediate result
0, 1, 2,...	Constant values due to the data format of the specified operation

•**Data Types**• This part specifies the particular data type according to the instruction. Basically, the following data types are possible:

BIT, BYTE, WORD, DOUBLEWORD

Except for those instructions which extend byte data to word data, all instructions have only one particular data type. Note that the data types mentioned in this subsection do not consider accesses to indirect address pointers or to the system stack which are always performed with word data. Moreover, no data type is specified for System Control Instructions and for those of the branch instructions which do not access any explicitly addressed data.

•**Description**• This part provides a brief verbal description of the action that is executed by the respective instruction.

•**Condition Code**• This notifies that the respective instruction contains a condition code, so it is executed, if the specified condition is true, and is skipped, if it is false. The table below summarizes the 16 possible condition codes that can be used within Call and Branch instructions. The table shows the mnemonic abbreviations, the test that is executed for a specific condition and the internal representation by a 4-bit number.

Condition Code Mnemonic cc	Test	Description	Condition Code Number c
cc_UC	1 = 1	Unconditional	0 <sub>H</sub>
cc_Z	Z = 1	Zero	2 <sub>H</sub>
cc_NZ	Z = 0	Not zero	3 <sub>H</sub>
cc_V	V = 1	Overflow	4 <sub>H</sub>
cc_NV	V = 0	No overflow	5 <sub>H</sub>
cc_N	N = 1	Negative	6 <sub>H</sub>
cc>NN	N = 0	Not negative	7 <sub>H</sub>
cc_C	C = 1	Carry	8 <sub>H</sub>
cc_NC	C = 0	No carry	9 <sub>H</sub>
cc_EQ	Z = 1	Equal	2 <sub>H</sub>
cc_NE	Z = 0	Not equal	3 <sub>H</sub>
cc_ULT	C = 1	Unsigned less than	8 <sub>H</sub>
cc_ULE	(Z∨C) = 1	Unsigned less than or equal	F <sub>H</sub>
cc_UGE	C = 0	Unsigned greater than or equal	9 <sub>H</sub>
cc_UGT	(Z∨C) = 0	Unsigned greater than	E <sub>H</sub>
cc_SLT	(N⊕V) = 1	Signed less than	C <sub>H</sub>
cc_SLE	(Z∨(N⊕V)) = 1	Signed less than or equal	B <sub>H</sub>
cc_SGE	(N⊕V) = 0	Signed greater than or equal	D <sub>H</sub>
cc_SGT	(Z∨(N⊕V)) = 0	Signed greater than	A <sub>H</sub>
cc_NET	(Z∨E) = 0	Not equal AND not end of table	1 <sub>H</sub>

•**Condition Flags**• This part reflects the state of the N, C, V, Z and E flags in the PSW register which is the state after execution of the corresponding instruction, except if the PSW register itself was specified as the destination operand of that instruction (see Note).

The resulting state of the flags is represented by symbols as follows:

- '\*'      The flag is set due to the following standard rules for the corresponding flag:
  - N = 1 :      MSB of the result is set
  - N = 0 :      MSB of the result is not set
  - C = 1 :      Carry occurred during operation
  - C = 0 :      No Carry occurred during operation
  - V = 1 :      Arithmetic Overflow occurred during operation
  - V = 0 :      No Arithmetic Overflow occurred during operation
  - Z = 1 :      Result equals zero
  - Z = 0 :      Result does not equal zero
  - E = 1 :      Source operand represents the lowest negative number  
(either 8000h for word data or 80h for byte data)
  - E = 0 :      Source operand does not represent the lowest negative  
number for the specified data type
- 'S'      The flag is set due to rules which deviate from the described standard.  
For more details see instruction pages (below) or the ALU status flags description.
- '-'      The flag is not affected by the operation.
- '0'      The flag is cleared by the operation.
- 'NOR'    The flag contains the logical NORing of the two specified bit operands.
- 'AND'    The flag contains the logical ANDing of the two specified bit operands.
- 'OR'     The flag contains the logical ORing of the two specified bit operands.
- 'XOR'    The flag contains the logical XORing of the two specified bit operands.
- 'B'      The flag contains the original value of the specified bit operand.
- ' $\bar{B}$ '    The flag contains the complemented value of the specified bit operand.

**Note:** If the PSW register was specified as the destination operand of an instruction, the condition flags can not be interpreted as just described, because the PSW register is modified depending on the data format of the instruction as follows:

For word operations, the PSW register is overwritten with the word result. For byte operations, the non-addressed byte is cleared and the addressed byte is overwritten. For bit or bit-field operations on the PSW register, only the specified bits are modified. Supposed that the condition flags were not selected as destination bits, they stay unchanged. This means that they keep the state after execution of the previous instruction.

In any case, if the PSW was the destination operand of an instruction, the PSW flags do NOT represent the condition flags of this instruction as usual.

•**Addressing Modes**• This part specifies which combinations of different addressing modes are available for the required operands. Mostly, the selected addressing mode combination is specified by the opcode of the corresponding instruction. However, there are some arithmetic and logical instructions where the addressing mode combination is not specified by the (identical) opcodes but by particular bits within the operand field.

The addressing mode entries are made up of three elements:

**Mnemonic** Shows an example of what operands the respective instruction will accept.

**Format** This part specifies the format of the instructions as it is represented in the assembler listing. The figure below shows the reference between the instruction format representation of the assembler and the corresponding internal organization of such an instruction format (N = nibble = 4 bits).

The following symbols are used to describe the instruction formats:

00<sub>H</sub> through FF<sub>H</sub> : Instruction Opcodes

0, 1 : Constant Values

:... : Each of the 4 characters immediately following a colon represents a single bit

...ii : 2-bit short GPR address (Rwi)

SS : Code segment number (seg). 8-bit for C165/7, 2-bit (:..ss) for SAB8xC166

..## : 2-bit immediate constant (#irang2)

..### : 3-bit immediate constant (#data3)

c : 4-bit condition code specification (cc)

n : 4-bit short GPR address (Rwn or Rbn)

m : 4-bit short GPR address (Rwm or Rbm)

q : 4-bit position of the source bit within the word specified by QQ

z : 4-bit position of the destination bit within the word specified by ZZ

# : 4-bit immediate constant (#data4)

t:ttt0 : 7-bit trap number (#trap7)

QQ : 8-bit word address of the source bit (bitoff)

rr : 8-bit relative target address word offset (rel)

RR : 8-bit word address reg

ZZ : 8-bit word address of the destination bit (bitoff)

## : 8-bit immediate constant (#data8)

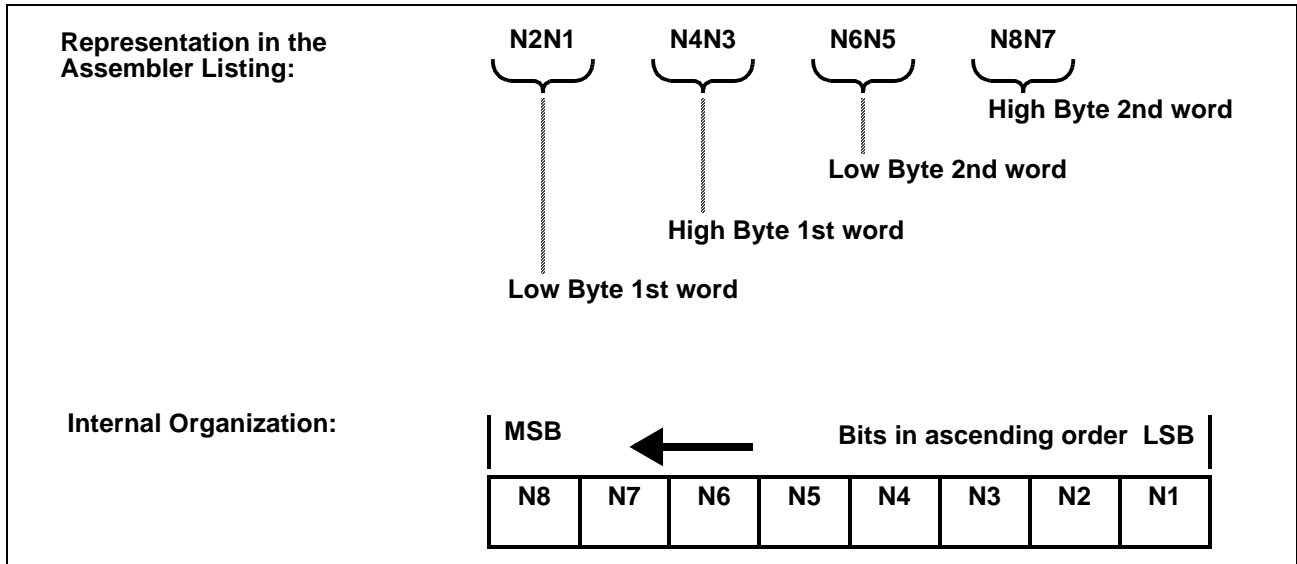

## xx : 8-bit immediate constant (represented by #data16, byte xx is not significant)

@@ : 8-bit immediate constant (#mask8)

MM MM : 16-bit address (mem or caddr; low byte, high byte)

## ## : 16-bit immediate constant (#data16; low byte, high byte)

**Number of Bytes** Specifies the size of an instruction in bytes. All C166 Family instructions consist of either 2 or 4 bytes. Regarding the instruction size, all instructions can be classified as either single word or double word instructions.

**Figure 5-1:** Instruction Format Representation

**Notes on the ATOMIC and EXTENDED Instructions**

These instructions (ATOMIC, EXTR, EXTP, EXTS, EXTPR, EXT SR) disable standard and PEC interrupts and class A traps during a sequence of the following 1...4 instructions. The length of the sequence is determined by an operand (op1 or op2, depending on the instruction). The EXTENDED instruction additionally change the addressing mechanism during this sequence (see detailed instruction description).

The ATOMIC and EXTENDED instructions become active immediately, so no additional NOPs are required. All instructions requiring multiple cycles or hold states to be executed are regarded as one instruction in this sense. Any instruction type can be used with the ATOMIC and EXTENDED instructions.

**CAUTION:** When a Class B trap interrupts an ATOMIC or EXTENDED sequence, this sequence is terminated, the interrupt lock is removed and the standard condition is restored, before the trap routine is executed! The remaining instructions of the terminated sequence that are executed after returning from the trap routine will run under standard conditions!

**CAUTION:** Be careful, when using the ATOMIC and EXTENDED instructions with other system control or branch instructions.

**CAUTION:** Be careful, when using nested ATOMIC and EXTENDED instructions. There is ONE counter to control the length of such a sequence, ie. issuing an ATOMIC or EXTENDED instruction within a sequence will reload the counter with value of the new instruction.

**Note:** The ATOMIC and EXTENDED instructions are not available in the SAB 8XC166(W) devices.

The following pages of this section contain a detailed description of each instruction of the C166 Family in alphabetical order.

### ADD

### Integer Addition

### ADD

**Syntax**            ADD        op1, op2

**Operation**         $(op1) \leftarrow (op1) + (op2)$

**Data Types**      WORD

**Description**      Performs a 2's complement binary addition of the source operand specified by op2 and the destination operand specified by op1. The sum is then stored in op1.

**Condition Flags**

E	Z	V	C	N
*	*	*	*	*

**E** Set if the value of op2 represents the lowest possible negative number. Cleared otherwise. Used to signal the end of a table.

**Z** Set if result equals zero. Cleared otherwise.

**V** Set if an arithmetic overflow occurred, ie. the result cannot be represented in the specified data type. Cleared otherwise.

**C** Set if a carry is generated from the most significant bit of the specified data type. Cleared otherwise.

**N** Set if the most significant bit of the result is set. Cleared otherwise.

**Addressing Modes**

Mnemonic		Format	Bytes
ADD	$Rw_n, Rw_m$	00 nm	2

### ADDB

### Integer Addition

### ADDB

**Syntax** ADDB op1, op2

**Operation**  $(op1) \leftarrow (op1) + (op2)$

**Data Types** BYTE

**Description** Performs a 2's complement binary addition of the source operand specified by op2 and the destination operand specified by op1. The sum is then stored in op1.

**Condition Flags**

E	Z	V	C	N
*	*	*	*	*

**E** Set if the value of op2 represents the lowest possible negative number. Cleared otherwise. Used to signal the end of a table.

**Z** Set if result equals zero. Cleared otherwise.

**V** Set if an arithmetic overflow occurred, ie. the result cannot be represented in the specified data type. Cleared otherwise.

**C** Set if a carry is generated from the most significant bit of the specified data type. Cleared otherwise.

**N** Set if the most significant bit of the result is set. Cleared otherwise.

# ADDC

## Integer Addition with Carry

# ADDC

**Syntax**                    ADDC     op1, op2

**Operation**                 $(op1) \leftarrow (op1) + (op2) + (C)$

**Data Types**             WORD

**Description**             Performs a 2's complement binary addition of the source operand specified by op2, the destination operand specified by op1 and the previously generated carry bit. The sum is then stored in op1. This instruction can be used to perform multiple precision arithmetic.

**Condition Flags**

E	Z	V	C	N
*	S	*	*	*

- E Set if the value of op2 represents the lowest possible negative number. Cleared otherwise. Used to signal the end of a table.
- Z Set if result equals zero and previous Z flag was set. Cleared otherwise.
- V Set if an arithmetic overflow occurred, ie. the result cannot be represented in the specified data type. Cleared otherwise.
- C Set if a carry is generated from the most significant bit of the specified data type. Cleared otherwise.
- N Set if the most significant bit of the result is set. Cleared otherwise.

# AND

## Logical AND

# AND

**Syntax**                    AND            op1, op2

**Operation**                (op1) ← (op1) ∧ (op2)

**Data Types**              WORD

**Description**              Performs a bitwise logical AND of the source operand specified by op2 and the destination operand specified by op1. The result is then stored in op1.

**Condition Flags**

E	Z	V	C	N
*	*	0	0	*

**E** Set if the value of op2 represents the lowest possible negative number. Cleared otherwise. Used to signal the end of a table.

**Z** Set if result equals zero. Cleared otherwise.

**V** Always cleared.

**C** Always cleared.

**N** Set if the most significant bit of the result is set. Cleared otherwise.

**Addressing Modes**

# ASHR

## Arithmetic Shift Right

# ASHR

**Syntax** ASHR op1, op2

**Operation**

```
(count) ← (op2)
(V) ← 0
(C) ← 0
DO WHILE (count) ≠ 0
  (V) ← (C) ∨ (V)
  (C) ← (op10)
  (op1n) ← (op1n+1) [n=0...14]
  (count) ← (count) - 1
END WHILE
```

**Data Types** WORD

**Description** Arithmetically shifts the destination word operand op1 right by as many times as specified in the source operand op2. To preserve the sign of the original operand op1, the most significant bits of the result are filled with zeros if the original MSB was a 0 or with ones if the original MSB was a 1. The Overflow flag is used as a Rounding flag. The LSB is shifted into the Carry. Only shift values between 0 and 15 are allowed. When using a GPR as the count control, only the least significant 4 bits are used.

**Condition Flags**

E	Z	V	C	N
0	*	S	S	*

- E Always cleared.
- Z Set if result equals zero. Cleared otherwise.
- V Set if in any cycle of the shift operation a 1 is shifted out of the carry flag. Cleared for a shift count of zero.
- C The carry flag is set according to the last LSB shifted out of op1. Cleared for a shift count of zero.
- N Set if the most significant bit of the result is set. Cleared otherwise.

Addressing Modes	Mnemonic	Format	Bytes
	ASHR	Rw <sub>n</sub> , Rw <sub>m</sub>	AC nm 2
	ASHR	Rw <sub>n</sub> , #data4	BC #n 2

# ATOMIC

### Begin ATOMIC Sequence

# ATOMIC

#### Syntax

ATOMIC op1

#### Operation

(count) ← (op1) [1 ≤ op1 ≤ 4]  
 Disable interrupts and Class A traps  
 DO WHILE ((count) ≠ 0 AND Class\_B\_trap\_condition ≠ TRUE)  
 Next Instruction  
 (count) ← (count) - 1  
 END WHILE  
 (count) = 0  
 Enable interrupts and traps

#### Description

Causes standard and PEC interrupts and class A hardware traps to be disabled for a specified number of instructions. The ATOMIC instruction becomes immediately active such that no additional NOPs are required. Depending on the value of op1, the period of validity of the ATOMIC sequence extends over the sequence of the next 1 to 4 instructions being executed after the ATOMIC instruction. All instructions requiring multiple cycles or hold states to be executed are regarded as one instruction in this sense. Any instruction type can be used with the ATOMIC instruction.

#### Note

The ATOMIC instruction must be used carefully (see introductory note). The ATOMIC instruction is not available in the SAB 8XC166(W) devices.

#### Condition Flags

E	Z	V	C	N
-	-	-	-	-

E Not affected.

Z Not affected.

V Not affected.

C Not affected.

N Not affected.

### BAND

### Bit Logical AND

### BAND

**Syntax** BAND op1, op2

**Operation**  $(op1) \leftarrow (op1) \wedge (op2)$

**Data Types** BIT

**Description** Performs a single bit logical AND of the source bit specified by op2 and the destination bit specified by op1. The result is then stored in op1.

**Condition Flags**

E	Z	V	C	N
0	NOR	OR	AND	XOR

E Always cleared.

Z Contains the logical NOR of the two specified bits.

V Contains the logical OR of the two specified bits.

C Contains the logical AND of the two specified bits.

N Contains the logical XOR of the two specified bits.

**Addressing Modes**

	BCLR	bitaddr <sub>Q,q</sub> qE QQ	2

### BCMP

### Bit to Bit Compare

### BCMP

**Syntax** BCMP op1, op2

**Operation** (op1)  $\Leftrightarrow$  (op2)

**Data Types** BIT

**Description** Performs a single bit comparison of the source bit specified by operand op1 to the source bit specified by operand op2. No result is written by this instruction. Only the condition codes are updated.

**Note:** The meaning of the condition flags for the BCMP instruction is different from the meaning of the flags for the other compare instructions.

**Condition Flags**

E	Z	V	C	N
0	NOR	OR	AND	XOR

E Always cleared.

Z Contains the logical NOR of the two specified bits.

V Contains the logical OR of the two specified bits.

C Contains the logical AND of the two specified bits.

N Contains the logical XOR of the two specified bits.

Addressing Modes	Mnemonic	Format	Bytes

### BFLDH

### Bit Field High Byte

### BFLDH

**Syntax** BFLDH op1, op2, op3

**Operation**  
 $(tmp) \leftarrow (op1)$   
 $(high\ byte\ (tmp)) \leftarrow ((high\ byte\ (tmp) \wedge \neg op2) \vee op3)$   
 $(op1) \leftarrow (tmp)$

**Data Types** WORD

**Description** Replaces those bits in the high byte of the destination word operand op1 which are selected by a '1' in the AND mask op2 with the bits at the corresponding positions in the OR mask specified by op3.

**Note:** op1 bits which shall remain unchanged must have a '0' in the respective bit of both the AND mask op2 and the OR mask op3. Otherwise a '1' in op3 will set the corresponding op1 bit (see „Operation“).

**Condition Flags**

E	Z	V	C	N

### BSET

### Bit Set

### BSET

**Syntax**            BSET     op1

**Operation**        (op1) ← 1

**Data Types**        BIT

**Description**        Sets the bit specified by op1. This instruction is primarily used for peripheral and system control.

**Condition Flags**

E	Z	V	C	N
0	$\bar{B}$	0	0	B

E Always cleared.

Z Contains the logical negation of the previous state of the specified bit.

V Always cleared.

C Always cleared.

N Contains the previous state of the specified bit.

<b>Addressing Modes</b>	Mnemonic	Format	Bytes
	BSET     bitaddr <sub>Q,q</sub>	qF QQ	2

# BXOR

## Bit Logical XOR

# BXOR

**Syntax** BXOR op1, op2

**Operation**  $(op1) \leftarrow (op1) \oplus (op2)$

**Data Types** BIT

**Description** Performs a single bit logical EXCLUSIVE OR of the source bit specified by operand op2 with the destination bit specified by operand op1. The XORed result is then stored in op1.

**Condition Flags**

E	Z	V	C	N
0	NOR	OR	AND	XOR

E Always cleared.

Z Contains the logical NOR of the two specified bits.

V Contains the logical OR of the two specified bits.

C Contains the logical AND of the two specified bits.

N Contains the logical XOR of the two specified bits.

<b>Addressing Modes</b>	Mnemonic	Format	Bytes
	BXOR bitaddr <sub>Z,z</sub> , bitaddr <sub>Q,q</sub>	7A QQ ZZ qz	4

# CALLA

## Call Subroutine Absolute

# CALLA

**Syntax** CALLA op1, op2

**Operation**

```

IF (op1) THEN
  (SP) ← (SP) - 2
  ((SP)) ← (IP)
  (IP) ← op2
ELSE
  next instruction
END IF
    
```

**Description** If the condition specified by op1 is met, a branch to the absolute memory location specified by the second operand op2 is taken. The value of the instruction pointer, IP, is placed onto the system stack. Because the IP always points to the instruction following the branch instruction, the value stored on the system stack represents the return address of the calling routine. If the condition is not met, no action is taken and the next instruction is executed normally.

**Condition Codes** See condition code table.

**Condition Flags**

E	Z	V	C	N
-	-	-	-	-

E Not affected.

Z Not affected.

V Not affected.

C Not affected.

N Not affected.

<b>Addressing Modes</b>	Mnemonic	Format	Bytes

### CALLI

### Call Subroutine Indirect

### CALLI

**Syntax** CALLI op1, op2

**Operation** IF (op1) THEN  
 (SP) ← (SP) - 2  
 ((SP)) ← (IP)  
 (IP) ← op2  
 ELSE  
 next instruction  
 END IF

**Description** If the condition specified by op1 is met, a branch to the location specified indirectly by the second operand op2 is taken. The value of the instruction pointer, IP, is placed onto the system stack. Because the IP always points to the instruction following the branch instruction, the value stored on the system stack represents the return address of the calling routine. If the condition is not met, no action is taken and the next instruction is executed normally.

**Condition Codes** See condition code table.

# CALLR

## Call Subroutine Relative

# CALLR

**Syntax** CALLR op1

**Operation**  
 $(SP) \leftarrow (SP) - 2$   
 $((SP)) \leftarrow (IP)$   
 $(IP) \leftarrow (IP) + \text{sign\_extend}(op1)$

**Description** A branch is taken to the location specified by the instruction pointer, IP, plus the relative displacement, op1. The displacement is a two's complement number which is sign extended and counts the relative distance in words. The value of the instruction pointer (IP) is placed onto the system stack. Because the IP always points to the instruction following the branch instruction, the value stored on the system stack represents the return address of the calling routine. The value of the IP used in the target address calculation is the address of the instruction following the CALLR instruction.

**Condition Codes** See condition code table.

**Condition Flags**

E	Z	V	C	N
-	-	-	-	-

### CALLS

### Call Inter-Segment Subroutine

### CALLS

**Syntax**                    CALLS     op1, op2

**Operation**

(SP) ← (SP) - 2  
 ((SP)) ← (CSP)  
 (SP) ← (SP) - 2  
 ((SP)) ← (IP)  
 (CSP) ← op1  
 (IP) ← op1

**Description**                    A branch is taken to the absolute location specified by op2 within the segment specified by op1. The value of the instruction pointer (IP) is placed onto the system stack. Because the IP always points to the instruction following the branch instruction, the value stored on the system stack represents the return address to the calling routine. The previous value of the CSP is also placed on the system stack to insure correct return to the calling segment.

# CMPD1

## Integer Compare and Decrement by 1

# CMPD1

**Syntax** CMPD1 op1, op2

**Operation** (op1)  $\Leftrightarrow$  (op2)  
(op1)  $\leftarrow$  (op1) - 1

**Data Types** WORD

**Description** This instruction is used to enhance the performance and flexibility of loops. The source operand specified by op1 is compared to the source operand specified by op2 by performing a 2's complement binary subtraction of op2 from op1. Operand op1 may specify ONLY GPR registers. Once the subtraction has completed, the operand op1 is decremented by one. Using the set flags, a branch instruction can then be used in conjunction with this instruction to form common high level language FOR loops of any range.

**Condition Flags**

**DISWDT**

**Disable Watchdog Timer**

**DISWDT**

**Syntax** DISWDT

**Operation** Disable the watchdog timer

**Description** This instruction disables the watchdog timer. The watchdog timer is enabled by a reset. The DISWDT instruction allows the watchdog timer to be disabled for applications which do not require a watchdog function. Following a reset, this instruction can be executed at any time until either a Service Watchdog Timer instruction (SRVWDT) or an End of Initialization instruction (EINIT) are executed. Once one of these instructions has been executed, the DISWDT instruction will have no effect. To insure that this instruction is not accidentally executed, it is implemented as a protected instruction.

### EINIT

### End of Initialization

### EINIT

**Syntax**

EINIT

**Operation**

End of Initialization

**Description**

This instruction is used to signal the end of the initialization portion of a program. After a reset, the reset output pin  $\overline{\text{RSTOUT}}$  is pulled low. It remains low until the EINIT instruction has been executed at which time it goes high. This enables the program to signal the external circuitry that it has successfully initialized the microcontroller. After the EINIT instruction has been executed, execution of the Disable Watchdog Timer instruction (DISWDT) has no effect. To insure that this instruction is not accidentally executed, it is implemented as a protected instruction.

### EXTR

### Begin EXTENDED Register Sequence

### EXTR

#### Syntax

EXTR      op1

#### Operation

(count) ← (op1) [1 ≤ op1 ≤ 4]  
 Disable interrupts and Class A traps  
 SFR\_range = Extended  
 DO WHILE ((count) ≠ 0 AND Class\_B\_trap\_condition ≠ TRUE)  
 Next Instruction  
 (count) ← (count) - 1  
 END WHILE  
 (count) = 0  
 SFR\_range = Standard  
 Enable interrupts and traps

#### Description

Causes all SFR or SFR bit accesses via the 'reg', 'bitoff' or 'bitaddr' addressing modes being made to the Extended SFR space for a specified number of instructions. During their execution, both standard and PEC interrupts and class A hardware traps are locked. The value of op1 defines the length of the effected instruction sequence.

#### Note

The EXTR instruction must be used carefully (see introductory note). The EXTR instruction is not available in the SAB 8XC166(W) devices.

### EXTP

### Begin EXTENDED Page Sequence

### EXTP

**Syntax**

EXTP      op1, op2

**Operation**

(count) ← (op2) [1 ≤ op2 ≤ 4]  
 Disable interrupts and Class A traps  
 Data\_Page = (op1)  
 DO WHILE ((count) ≠ 0 AND Class\_B\_trap\_condition ≠ TRUE)  
   Next Instruction  
   (count) ← (count) - 1  
 END WHILE  
 (count) = 0  
 Data\_Page = (DPPx)  
 Enable interrupts and traps

**Description**

Overrides the standard DPP addressing scheme of the long and indirect addressing modes for a specified number of instructions. During their execution, both standard and PEC interrupts and class A hardware traps are locked. The EXTP instruction becomes immediately active such that no additional NOPs are required.  
 For any long ('mem') or indirect ([...]) address in the EXTP instruction sequence, the 10-bit page number (address bits A23-A14) is not determined by the contents of a DPP register but by the value of op1 itself. The 14-bit page offset (address bits A13-A0) is derived from the long or indirect address as usual.  
 The value of op2 defines the length of the effected instruction sequence.

**Note**

The EXTP instruction must be used carefully (see introductory note).  
 The EXTP instruction is not available in the SAB 8XC166(W) devices.

### JBC

### Relative Jump if Bit Set and Clear Bit

### JBC

#### Syntax

JBC          op1, op2

#### Operation

```
IF (op1) = 1 THEN
  (op1) = 0
  (IP) ← (IP) + sign_extend (op2)
ELSE
  Next Instruction
END IF
```

#### Data Types

BIT

#### Description

If the bit specified by op1 is set, program execution continues at the location of the instruction pointer, IP, plus the specified displacement, op2. The bit specified by op1 is cleared, allowing implementation of semaphore operations. The displacement is a two's complement number which is sign extended and counts the relative distance in words. The value of the IP used in the target address calculation is the address of the instruction following the JBC instruction. If the specified bit was clear, the instruction following the JBC instruction is executed.

#### Condition Flags

JBC          bitaddr <sub>Q,q</sub> , rel	AA QQ rr q0	4

### JMPA

### Absolute Conditional Jump

### JMPA

**Syntax** JMPA op1, op2

**Operation** IF (op1) = 1 THEN  
(IP) ← op2  
ELSE  
Next Instruction  
END IF

**Description** If the condition specified by op1 is met, a branch to the absolute address specified by op2 is taken. If the condition is not met, no action is taken, and the instruction following the JMPA instruction is executed normally.

**Condition Codes** See condition code table.

**Condition Flags**

E	Z	V	C	N
-	-	-	-	-

E Not affected.

Z Not affected.

V Not affected.

C Not affected.

N Not affected.

<b>Addressing Modes</b>	Mnemonic	Format	Bytes
	JMPA cc, caddr	EA c0 MM MM	4

**JMPI**

**Indirect Conditional Jump**

**JMPI**

**Syntax** JMPI op1, op2

**Operation** IF (op1) = 1 THEN  
(IP) ← op2  
ELSE  
Next Instruction  
END IF

**Description** If the condition specified by op1 is met, a branch to the absolute address specified by op2 is taken. If the condition is not met, no action is taken, and the instruction following the JMPI instruction is executed normally.

**Condition Codes** See condition code table.

**Condition Flags**

# JMPR

## Relative Conditional Jump

# JMPR

**Syntax** JMPR op1, op2

**Operation** IF (op1) = 1 THEN  
 (IP) ← (IP) + sign\_extend (op2)  
 ELSE  
 Next Instruction  
 END IF

**Description** If the condition specified by op1 is met, program execution continues at the location of the instruction pointer, IP, plus the specified displacement, op2. The displacement is a two's complement number which is sign extended and counts the relative distance in words. The value of the IP used in the target address calculation is the address of the instruction following the JMPR instruction. If the specified condition is not met, program execution continues normally with the instruction following the JMPR instruction.

**Condition Codes** See condition code table.

**Condition Flags**

E	Z	V	C	N
-	-	-	-	-

- E Not affected.
- Z Not affected.
- V Not affected.
- C Not affected.
- N Not affected.

<b>Addressing Modes</b>	Mnemonic	Format	Bytes
	JMPR cc, rel	cD rr	2

### JMPS

### Absolute Inter-Segment Jump

### JMPS

**Syntax** JMPS op1, op2

**Operation** (CSP) ← op1  
(IP) ← op2

**Description** Branches unconditionally to the absolute address specified by op2 within the segment specified by op1.

**Condition Flags**

E	Z	V	C	N
-	-	-	-	-

E Not affected.

Z Not affected.

V Not affected.

C Not affected.

N Not affected.

Addressing Modes	Mnemonic	Format	Bytes
	JMPS seg, caddr	FA SS MM MM	4

**JNB**

**Relative Jump if Bit Clear**

**JNB**

**Syntax** JNB op1, op2

**Operation** IF (op1) = 0 THEN  
(IP) ← (IP) + sign\_extend (op2)  
ELSE  
Next Instruction  
END IF

**Data Types** BIT

**Description** If the bit specified by op1 is clear, program execution continues at the location of the instruction pointer, IP, plus the specified displacement, op2. The displacement is a two's complement number which is sign extended and counts the relative distance in words. The value of the IP used in the target address calculation is the address of the instruction following the JNB instruction. If the specified bit is set, the instruction following the JNB instruction is executed.

**Condition Flags**

E	Z	V	C	N
-	-	-	-	-

- E Not affected.
- Z Not affected.
- V Not affected.
- C Not affected.
- N Not affected.

<b>Addressing Modes</b>	Mnemonic	Format	Bytes
	JNB bitaddr <sub>Q,q</sub> , rel	9A QQ rr q0	4

### JNBS

### Relative Jump if Bit Clear and Set Bit

### JNBS

#### Syntax

JNBS      op1, op2

#### Operation

```
IF (op1) = 0 THEN
  (op1) = 1
  (IP) ← (IP) + sign_extend (op2)
ELSE
  Next Instruction
END IF
```

#### Data Types

BIT

#### Description

If the bit specified by op1 is clear, program execution continues at the location of the instruction pointer, IP, plus the specified displacement, op2. The bit specified by op1 is set, allowing implementation of semaphore operations. The displacement is a two's complement number which is sign extended and counts the relative distance in words. The value of the IP used in the target address calculation is the address of the instruction following the JNBS instruction. If the specified bit was set, the instruction following the JNBS instruction is executed.

#### Condition Flags

E	Z	V	C	N
0	$\bar{B}$	0	0	B

E Always cleared.

Z Contains logical negation of the previous state of the specified bit.

V Always cleared.

C Always cleared.

N Contains the previous state of the specified bit.

#### Addressing Modes

JNBS      bitaddr <sub>Q,q</sub> , rel	BA QQ rr q0	4

# MOV

## Move Data

# MOV

**Syntax** MOV op1, op2

**Operation** (op1) ← (op2)

**Data Types** WORD

**Description** Moves the contents of the source operand specified by op2 to the location specified by the destination operand op1. The contents of the moved data is examined, and the condition codes are updated accordingly.

### Condition Flags

E	Z	V	C	N
*	*	-	-	*

**E** Set if the value of op2 represents the lowest possible negative number. Cleared otherwise. Used to signal the end of a table.

**Z** Set if the value of the source operand op2 equals zero. Cleared otherwise.

**V** Not affected.

**C** Not affected.

**N** Set if the most significant bit of the source operand op2 is set. Cleared otherwise.

### MOVB

### Move Data

### MOVB

**Syntax**                    MOVB      op1, op2

**Operation**                (op1) ← (op2)

**Data Types**              BYTE

**Description**              Moves the contents of the source operand specified by op2 to the location specified by the destination operand op1. The contents of the moved data is examined, and the condition codes are updated accordingly.

**Condition Flags**

E	Z	V	C	N
*	*	-	-	*

E Set if the value of op2 represents the lowest possible negative number. Cleared otherwise. Used to signal the end of a table.

Z Set if the value of the source operand op2 equals zero. Cleared otherwise.

V Not affected.

C Not affected.

N Set if the most significant bit of the source operand op2 is set. Cleared otherwise.

# MOVBS

### Move Byte Sign Extend

# MOVBS

**Syntax** MOVBS op1, op2

**Operation**  
 (low byte op1) ← (op2)  
 IF (op2<sub>7</sub>) = 1 THEN  
 (high byte op1) ← FF<sub>H</sub>  
 ELSE  
 (high byte op1) ← 00<sub>H</sub>  
 END IF

**Data Types** WORD, BYTE

**Description** Moves and sign extends the contents of the source byte specified by op2 to the word location specified by the destination operand op1. The contents of the moved data is examined, and the condition codes are updated accordingly.

**Condition Flags**

E	Z	V	C	N
0	*	-	-	*

E Always cleared.

Z Set if the value of the source operand op2 equals zero. Cleared otherwise.

V Not affected.

C Not affected.

N Set if the most significant bit of the source operand op2 is set. Cleared otherwise.

	MOVBS mem, reg	D5 RR MM MM	4

# MOVBZ

## Move Byte Zero Extend

# MOVBZ

**Syntax**                    MOVBZ    op1, op2

**Operation**                (low byte op1) ← (op2)  
 (high byte op1) ← 00<sub>H</sub>

**Data Types**              WORD, BYTE

**Description**              Moves and zero extends the contents of the source byte specified by op2 to the word location specified by the destination operand op1. The contents of the moved data is examined, and the condition codes are updated accordingly.

**Condition Flags**

E	Z	V	C	N
0	*	-	-	0

E Always cleared.

Z Set if the value of the source operand op2 equals zero. Cleared otherwise.

V Not affected.

C Not affected.

N Always cleared.

### MUL

### Signed Multiplication

### MUL

**Syntax** MUL op1, op2

**Operation** (MD) ← (op1) \* (op2)

**Data Types** WORD

**Description** Performs a 16-bit by 16-bit signed multiplication using the two words specified by operands op1 and op2 respectively. The signed 32-bit result is placed in the MD register.

**Condition Flags**

E	Z	V	C	N
0	*	S	0	*

E Always cleared.

Z Set if the result equals zero. Cleared otherwise.

V This bit is set if the result cannot be represented in a word data type. Cleared otherwise.

C Always cleared.

N Set if the most significant bit of the result is set. Cleared otherwise.

Addressing Modes	Mnemonic	Format	Bytes
	MUL	Rw <sub>n</sub> , Rw <sub>m</sub>	0B nm 2

### MULU

### Unsigned Multiplication

### MULU

**Syntax** MULU op1, op2

**Operation** (MD) ← (op1) \* (op2)

**Data Types** WORD

**Description** Performs a 16-bit by 16-bit unsigned multiplication using the two words specified by operands op1 and op2 respectively. The unsigned 32-bit result is placed in the MD register.

**Condition Flags**

E	Z	V	C	N
0	*	S	0	*

E Always cleared.

Z Set if the result equals zero. Cleared otherwise.

V This bit is set if the result cannot be represented in a word data type. Cleared otherwise.

C Always cleared.

N Set if the most significant bit of the result is set. Cleared otherwise.

Addressing Modes	Mnemonic	Format	Bytes
	MULU	Rw <sub>n</sub> , Rw <sub>m</sub>	1B nm
			2

### NEG

### Integer Two's Complement

### NEG

**Syntax**                    NEG        op1

**Operation**                (op1) ← 0 - (op1)

**Data Types**              WORD

**Description**              Performs a binary 2's complement of the source operand specified by op1. The result is then stored in op1.

**Condition Flags**

E	Z	V	C	N
*	*	*	S	*

E Set if the value of op1 represents the lowest possible negative number. Cleared otherwise. Used to signal the end of a table.

Z Set if result equals zero. Cleared otherwise.

V Set if an arithmetic underflow occurred, ie. the result cannot be represented in the specified data type. Cleared otherwise.

C Set if a borrow is generated. Cleared otherwise.

N Set if the most significant bit of the result is set. Cleared otherwise.

<b>Addressing Modes</b>	Mnemonic	Format	Bytes
	NEG        R <sub>w<sub>n</sub></sub>	81 n0	2

### NEGB

### Integer Two's Complement

### NEGB

**Syntax** NEGB op1

**Operation** (op1) ← 0 - (op1)

**Data Types** BYTE

**Description** Performs a binary 2's complement of the source operand specified by op1. The result is then stored in op1.

**Condition Flags**

E	Z	V	C	N
*	*	*	S	*

**E** Set if the value of op1 represents the lowest possible negative number. Cleared otherwise. Used to signal the end of a table.

**Z** Set if result equals zero. Cleared otherwise.

**V** Set if an arithmetic underflow occurred, ie. the result cannot be represented in the specified data type. Cleared otherwise.

**C** Set if a borrow is generated. Cleared otherwise.

**N** Set if the most significant bit of the result is set. Cleared otherwise.

Addressing Modes	Mnemonic	Format	Bytes
	NEGB Rb <sub>n</sub>	A1 n0	2

# NOP

## No Operation

# NOP

**Syntax** NOP

**Operation** No Operation

**Description** This instruction causes a null operation to be performed. A null operation causes no change in the status of the flags.

**Condition Flags**

E	Z	V	C	N
-	-	-	-	-

E Not affected.

Z Not affected.

V Not affected.

C Not affected.

N Not affected.

<b>Addressing Modes</b>	Mnemonic	Format	Bytes
	NOP	CC 00	2

# OR

## Logical OR

# OR

**Syntax** OR op1, op2

**Operation**  $(op1) \leftarrow (op1) \vee (op2)$

**Data Types** WORD

**Description** Performs a bitwise logical OR of the source operand specified by op2 and the destination operand specified by op1. The result is then stored in op1.

### Condition Flags

E	Z	V	C	N
*	*	0	0	*

**E** Set if the value of op2 represents the lowest possible negative number. Cleared otherwise. Used to signal the end of a table.

**Z** Set if result equals zero. Cleared otherwise.

**V** Always cleared.

**C** Always cleared.

**N** Set if the most significant bit of the result is set. Cleared otherwise.

### Addressing Modes

Mnemonic	Format	Bytes
OR $Rw_n, Rw_m$	70 nm	2
OR $Rw_n, [Rw_i]$	78 n:10ii	2

OR $Rw_n, \#data3$	78 n:0###	2
OR $reg, \#data16$	76 RR ## ##	4
OR $reg, mem$	72 RR MM MM	4
OR $mem, reg$	74 RR MM MM	4

# ORB

## Logical OR

# ORB

**Syntax** ORB op1, op2

**Operation**  $(op1) \leftarrow (op1) \vee (op2)$

**Data Types** BYTE

**Description** Performs a bitwise logical OR of the source operand specified by op2 and the destination operand specified by op1. The result is then stored in op1.

### Condition Flags

E	Z	V	C	N
*	*	0	0	*

**E** Set if the value of op2 represents the lowest possible negative number. Cleared otherwise. Used to signal the end of a table.

**Z** Set if result equals zero. Cleared otherwise.

**V** Always cleared.

**C** Always cleared.

**N** Set if the most significant bit of the result is set. Cleared otherwise.

### Addressing Modes

ORB Rb <sub>n</sub> , [Rw <sub>i</sub> +]	79 n:11ii	2
ORB Rb <sub>n</sub> , #data3	79 n:0###	2
ORB reg, #data16	77 RR ## xx	4
ORB reg, mem	73 RR MM MM	4
ORB mem, reg	75 RR MM MM	4

### PCALL

### Push Word and Call Subroutine Absolute

### PCALL

**Syntax** PCALL op1, op2

**Operation**

```
(tmp) ← (op1)
(SP) ← (SP) - 2
((SP)) ← (tmp)
(SP) ← (SP) - 2
((SP)) ← (IP)
(IP) ← op2
```

**Data Types** WORD

**Description** Pushes the word specified by operand op1 and the value of the instruction pointer, IP, onto the system stack, and branches to the absolute memory location specified by the second operand op2. Because IP always points to the instruction following the branch instruction, the value stored on the system stack represents the return address of the calling routine.

**Condition Flags**

E	Z	V	C	N
*	*	-	-	*

- E Set if the value of the pushed operand op1 represents the lowest possible negative number. Cleared otherwise. Used to signal the end of a table.
- Z Set if the value of the pushed operand op1 equals zero. Cleared otherwise.
- V Not affected.
- C Not affected.
- N Set if the most significant bit of the pushed operand op1 is set. Cleared otherwise.

<b>Addressing Modes</b>	Mnemonic	Format	Bytes
	PCALL reg, caddr	E2 RR MM MM	4

**POP**

**Pop Word from System Stack**

**POP**

**Syntax** POP op1

**Operation**  
 $(tmp) \leftarrow ((SP))$   
 $(SP) \leftarrow (SP) + 2$   
 $(op1) \leftarrow (tmp)$

**Data Types** WORD

**Description** Pops one word from the system stack specified by the Stack Pointer into the operand specified by op1. The Stack Pointer is then incremented by two.

**Condition Flags**

<b>E</b>	<b>Z</b>	<b>V</b>	<b>C</b>	<b>N</b>
*	*	-	-	*

- E** Set if the value of the popped word represents the lowest possible negative number. Cleared otherwise. Used to signal the end of a table.
- Z** Set if the value of the popped word equals zero. Cleared otherwise.
- V** Not affected.
- C** Not affected.
- N** Set if the most significant bit of the popped word is set. Cleared otherwise.

<b>Addressing Modes</b>	Mnemonic	Format	Bytes
	POP reg	FC RR	2

### PRIOR

### Prioritize Register

### PRIOR

**Syntax** PRIOR op1, op2

**Operation**

```
(tmp) ← (op2)
(count) ← 0
DO WHILE (tmp15) ≠ 1 AND (count) ≠ 15 AND (op2) ≠ 0
    (tmpn) ← (tmpn-1)
    (count) ← (count) + 1
END WHILE
(op1) ← (count)
```

**Data Types** WORD

**Description** This instruction stores a count value in the word operand specified by op1 indicating the number of single bit shifts required to normalize the operand op2 so that its MSB is equal to one. If the source operand op2 equals zero, a zero is written to operand op1 and the zero flag is set. Otherwise the zero flag is cleared.

**Condition Flags**

E	Z	V	C	N
0	*	0	0	0

E Always cleared.

Z Set if the source operand op2 equals zero. Cleared otherwise.

V Always cleared.

C Always cleared.

N Always cleared.

<b>Addressing Modes</b>	Mnemonic	Format	Bytes
	PRIOR $Rw_n, Rw_m$	2B nm	2

# PUSH

### Push Word on System Stack

# PUSH

**Syntax** PUSH op1

**Operation**  
 $(tmp) \leftarrow (op1)$   
 $(SP) \leftarrow (SP) - 2$   
 $((SP)) \leftarrow (tmp)$

**Data Types** WORD

**Description** Moves the word specified by operand op1 to the location in the internal system stack specified by the Stack Pointer, after the Stack Pointer has been decremented by two.

**Condition Flags**

E	Z	V	C	N
*	*	-	-	*

**E** Set if the value of the pushed word represents the lowest possible negative number. Cleared otherwise. Used to signal the end of a table.

**Z** Set if the value of the pushed word equals zero. Cleared otherwise.

**V** Not affected.

**C** Not affected.

**N** Set if the most significant bit of the pushed word is set. Cleared otherwise.

<b>Addressing Modes</b>	Mnemonic	Format	Bytes
	PUSH reg	EC RR	2

### PWRDN

### Enter Power Down Mode

### PWRDN

**Syntax** PWRDN

**Operation** Enter Power Down Mode

**Description** This instruction causes the part to enter the power down mode. In this mode, all peripherals and the CPU are powered down until the part is externally reset. To insure that this instruction is not accidentally executed, it is implemented as a protected instruction. To further control the action of this instruction, the PWRDN instruction is only enabled when the non-maskable interrupt pin ( $\overline{NMI}$ ) is in the low state. Otherwise, this instruction has no effect.

**Condition Flags**

E	Z	V	C	N
-	-	-	-	-

E Not affected.

Z Not affected.

V Not affected.

C Not affected.

N Not affected.

<b>Addressing Modes</b>	Mnemonic	Format	Bytes
	PWRDN	97 68 97 97	4

### RET

### Return from Subroutine

### RET

<b>Syntax</b>	RET				
<b>Operation</b>	$(IP) \leftarrow ((SP))$ $(SP) \leftarrow (SP) + 2$				
<b>Description</b>	Returns from a subroutine. The IP is popped from the system stack. Execution resumes at the instruction following the CALL instruction in the calling routine.				
<b>Condition Flags</b>	<b>E</b>	<b>Z</b>	<b>V</b>	<b>C</b>	<b>N</b>
	-	-	-	-	-
	E Not affected.				
	Z Not affected.				
	V Not affected.				
	C Not affected.				
	N Not affected.				
<b>Addressing Modes</b>	Mnemonic		Format		Bytes
	RET		CB 00		2

**RETI**

**Return from Interrupt Routine**

**RETI**

**Syntax**

RETI

**Operation**

(IP) ← ((SP))  
 (SP) ← (SP) + 2  
 IF (SYSCON.SGTDIS=0) THEN  
 (CSP) ← ((SP))  
 (SP) ← (SP) + 2  
 END IF  
 (PSW) ← ((SP))  
 (SP) ← (SP) + 2

**Description**

Returns from an interrupt routine. The PSW, IP, and CSP are popped off the system stack. Execution resumes at the instruction which had been interrupted. The previous system state is restored after the PSW has been popped. The CSP is only popped if segmentation is enabled. This is indicated by the SGTDIS bit in the SYSCON register.

**Condition Flags**

<b>E</b>	<b>Z</b>	<b>V</b>	<b>C</b>	<b>N</b>
S	S	S	S	S

- E Restored from the PSW popped from stack.
- Z Restored from the PSW popped from stack.
- V Restored from the PSW popped from stack.
- C Restored from the PSW popped from stack.
- N Restored from the PSW popped from stack.

**Addressing Modes**

Mnemonic	Format	Bytes
RETI	FB 88	2

### RETP

### Return from Subroutine and Pop Word

### RETP

**Syntax**                    RETP      op1

**Operation**

(IP) ← ((SP))  
 (SP) ← (SP) + 2  
 (tmp) ← ((SP))  
 (SP) ← (SP) + 2  
 (op1) ← (tmp)

**Data Types**              WORD

**Description**              Returns from a subroutine. The IP is first popped from the system stack and then the next word is popped from the system stack into the operand specified by op1. Execution resumes at the instruction following the CALL instruction in the calling routine.

**Condition Flags**

E	Z	V	C	N
*	*	-	-	*

- E Set if the value of the word popped into operand op1 represents the lowest possible negative number. Cleared otherwise. Used to signal the end of a table.
- Z Set if the value of the word popped into operand op1 equals zero. Cleared otherwise.
- V Not affected.
- C Not affected.
- N Set if the most significant bit of the word popped into operand op1 is set. Cleared otherwise.

<b>Addressing Modes</b>	Mnemonic	Format	Bytes
	RETP      reg	EB RR	2

### RETS

### Return from Inter-Segment Subroutine

### RETS

**Syntax**

RETS

**Operation**

$(IP) \leftarrow ((SP))$   
 $(SP) \leftarrow (SP) + 2$   
 $(CSP) \leftarrow ((SP))$   
 $(SP) \leftarrow (SP) + 2$

**Description**

Returns from an inter-segment subroutine. The IP and CSP are popped from the system stack. Execution resumes at the instruction following the CALLS instruction in the calling routine.

**Condition Flags**

E	Z	V	C	N
-	-	-	-	-

- E Not affected.
- Z Not affected.
- V Not affected.
- C Not affected.
- N Not affected.

**Addressing Modes**

RETS	DB 00	2

### ROL

### Rotate Left

### ROL

**Syntax** ROL op1, op2

**Operation**

```
(count) ← (op2)
(C) ← 0
DO WHILE (count) ≠ 0
  (C) ← (op115)
  (op1n) ← (op1n-1) [n=1...15]
  (op10) ← (C)
  (count) ← (count) - 1
END WHILE
```

**Data Types** WORD

**Description** Rotates the destination word operand op1 left by as many times as specified by the source operand op2. Bit 15 is rotated into Bit 0 and into the Carry. Only shift values between 0 and 15 are allowed. When using a GPR as the count control, only the least significant 4 bits are used.

**Condition Flags**

E	Z	V	C	N
0	*	0	S	*

E Always cleared.

Z Set if result equals zero. Cleared otherwise.

V Always cleared.

C The carry flag is set according to the last MSB shifted out of op1. Cleared for a rotate count of zero.

N Set if the most significant bit of the result is set. Cleared otherwise.

Addressing Modes	Mnemonic	Format	Bytes
	ROL	Rw <sub>n</sub> , Rw <sub>m</sub>	2
	ROL	Rw <sub>n</sub> , #data4	2

### ROR

### Rotate Right

### ROR

**Syntax** ROR op1, op2

**Operation**

```
(count) ← (op2)
(C) ← 0
(V) ← 0
DO WHILE (count) ≠ 0
  (V) ← (V) ∨ (C)
  (C) ← (op10)
  (op1n) ← (op1n+1) [n=0...14]
  (op115) ← (C)
  (count) ← (count) - 1
END WHILE
```

**Data Types** WORD

**Description** Rotates the destination word operand op1 right by as many times as specified by the source operand op2. Bit 0 is rotated into Bit 15 and into the Carry. Only shift values between 0 and 15 are allowed. When using a GPR as the count control, only the least significant 4 bits are used.

**Condition Flags**

E	Z	V	C	N
0	*	S	S	*

E Always cleared.

Z Set if result equals zero. Cleared otherwise.

V Set if in any cycle of the rotate operation a '1' is shifted out of the carry flag. Cleared for a rotate count of zero.

C The carry flag is set according to the last LSB shifted out of op1. Cleared for a rotate count of zero.

N Set if the most significant bit of the result is set. Cleared otherwise.

Addressing Modes	Mnemonic	Format	Bytes
	ROR	Rw <sub>n</sub> , Rw <sub>m</sub>	2C nm 2
	ROR	Rw <sub>n</sub> , #data4	3C #n 2

**SCXT**

**Switch Context**

**SCXT**

**Syntax** SCXT op1, op2

**Operation**  
 (tmp1) ← (op1)  
 (tmp2) ← (op2)  
 (SP) ← (SP) - 2  
 ((SP)) ← (tmp1)  
 (op1) ← (tmp2)

**Data Types** WORD

**Description** Used to switch contexts for any register. Switching context is a push and load operation. The contents of the register specified by the first operand, op1, are pushed onto the stack. That register is then loaded with the value specified by the second operand, op2.

**Condition Flags**

E	Z	V	C	N
-	-	-	-	-

- E Not affected.
- Z Not affected.
- V Not affected.
- C Not affected.
- N Not affected.

<b>Addressing Modes</b>	Mnemonic	Format	Bytes

	SCXT reg, mem	D6 RR MM MM	4

### SHL

### Shift Left

### SHL

**Syntax** SHL op1, op2

**Operation**

```
(count) ← (op2)
(C) ← 0
DO WHILE (count) ≠ 0
  (C) ← (op115)
  (op1n) ← (op1n-1) [n=1...15]
  (op10) ← 0
  (count) ← (count) - 1
END WHILE
```

**Data Types** WORD

**Description** Shifts the destination word operand op1 left by as many times as specified by the source operand op2. The least significant bits of the result are filled with zeros accordingly. The MSB is shifted into the Carry. Only shift values between 0 and 15 are allowed. When using a GPR as the count control, only the least significant 4 bits are used.

**Condition Flags**

E	Z	V	C	N
0	*	0	S	*

E Always cleared.

Z Set if result equals zero. Cleared otherwise.

V Always cleared.

C The carry flag is set according to the last MSB shifted out of op1. Cleared for a shift count of zero.

N Set if the most significant bit of the result is set. Cleared otherwise.

	SHL	Rw <sub>n</sub> , #data4	5C #n 2

### SHR

### Shift Right

### SHR

**Syntax** SHR op1, op2

**Operation**

```
(count) ← (op2)
(C) ← 0
(V) ← 0
DO WHILE (count) ≠ 0
  (V) ← (C) ∨ (V)
  (C) ← (op10)
  (op1n) ← (op1n+1) [n=0...14]
  (op115) ← 0
  (count) ← (count) - 1
END WHILE
```

**Data Types** WORD

**Description** Shifts the destination word operand op1 right by as many times as specified by the source operand op2. The most significant bits of the result are filled with zeros accordingly. Since the bits shifted out effectively represent the remainder, the Overflow flag is used instead as a Rounding flag. This flag together with the Carry flag helps the user to determine whether the remainder bits lost were greater than, less than or equal to one half an LSB. Only shift values between 0 and 15 are allowed. When using a GPR as the count control, only the least significant 4 bits are used.

**Condition Flags**

E	Z	V	C	N
0	*	S	S	*

E Always cleared.

Z Set if result equals zero. Cleared otherwise.

V Set if in any cycle of the shift operation a '1' is shifted out of the carry flag. Cleared for a shift count of zero.

C The carry flag is set according to the last LSB shifted out of op1. Cleared for a shift count of zero.

N Set if the most significant bit of the result is set. Cleared otherwise.

### TRAP

### Software Trap

### TRAP

**Syntax** TRAP op1

**Operation**

```

(SP) ← (SP) - 2
((SP)) ← (PSW)
IF (SYSCON.SGTDIS=0) THEN
  (SP) ← (SP) - 2
  ((SP)) ← (CSP)
  (CSP) ← 0
END IF
(SP) ← (SP) - 2
((SP)) ← (IP)
(IP) ← zero_extend (op1*4)
  
```

**Description** Invokes a trap or interrupt routine based on the specified operand, op1. The invoked routine is determined by branching to the specified vector table entry point. This routine has no indication of whether it was called by software or hardware. System state is preserved identically to hardware interrupt entry except that the CPU priority level is not affected. The RETI, return from interrupt, instruction is used to resume execution after the trap or interrupt routine has completed. The CSP is pushed if segmentation is enabled. This is indicated by the SGTDIS bit in the SYSCON register.

### 6 Addressing Modes

The Siemens 16-bit microcontrollers provide a lot of powerful addressing modes for access to word, byte and bit data (short, long, indirect), or to specify the target address of a branch instruction (absolute, relative, indirect). The different addressing modes use different formats and cover different scopes.

#### Short Addressing Modes

All of these addressing modes use an implicit base offset address to specify an 18-bit or 24-bit physical address (SAB 80C166 group or C167/5 group, respectively).

Short addressing modes allow to access the GPR, SFR or bit-addressable memory space:

$$\text{Physical Address} = \text{Base Address} + \Delta * \text{Short Address}$$

**Note:**  $\Delta$  is 1 for byte GPRs,  $\Delta$  is 2 for word GPRs.

Mnemonic	Physical Address	Short Address Range	Scope of Access
<b>Rw</b>	(CP) + 2*Rw	Rw = 0...15	GPRs (Word)
<b>Rb</b>	(CP) + 1*Rb	Rb = 0...15	GPRs (Byte)
<b>reg</b>	00'FE00 <sub>H</sub> + 2*reg 00'F000 <sub>H</sub> + 2*reg <sup>*)</sup> (CP) + 2*(reg^0F <sub>H</sub> ) (CP) + 1*(reg^0F <sub>H</sub> )	reg = 00 <sub>H</sub> ...EF <sub>H</sub> reg = 00 <sub>H</sub> ...EF <sub>H</sub> reg = F0 <sub>H</sub> ...FF <sub>H</sub> reg = F0 <sub>H</sub> ...FF <sub>H</sub>	SFRs (Word, Low byte) ESFRs (Word, Low byte) <sup>*)</sup> GPRs (Word) GPRs (Bytes)
<b>bitoff</b>	00'FD00 <sub>H</sub> + 2*bitoff 00'FF00 <sub>H</sub> + 2*(bitoff^FF <sub>H</sub> ) (CP) + 2*(bitoff^0F <sub>H</sub> )	bitoff = 00 <sub>H</sub> ...7F <sub>H</sub> bitoff = 80 <sub>H</sub> ...EF <sub>H</sub> bitoff = F0 <sub>H</sub> ...FF <sub>H</sub>	RAM Bit word offset SFR Bit word offset GPR Bit word offset
<b>bitaddr</b>	Word offset as with bitoff. Immediate bit position.	bitoff = 00 <sub>H</sub> ...FF <sub>H</sub> bitpos = 0...15	Any single bit

<sup>\*)</sup> The Extended Special Function Register (ESFR) area is not available in the SAB 8XC166(W) devices.

- Rw, Rb:** Specifies direct access to any GPR in the currently active context (register bank). Both 'Rw' and 'Rb' require four bits in the instruction format. The base address of the current register bank is determined by the content of register CP. 'Rw' specifies a 4-bit word GPR address relative to the base address (CP), while 'Rb' specifies a 4 bit byte GPR address relative to the base address (CP).
- reg:** Specifies direct access to any (E)SFR or GPR in the currently active context (register bank). 'reg' requires eight bits in the instruction format. Short 'reg' addresses from 00<sub>H</sub> to EF<sub>H</sub> always specify (E)SFRs. In that case, the factor 'Δ' equates 2 and the base address is 00'FE00<sub>H</sub> for the standard SFR area or 00'F000<sub>H</sub> for the extended ESFR area. 'reg' accesses to the ESFR area require a preceding EXT\*R instruction to switch the base address (not available in the SAB 8XC166(W) devices). Depending on the opcode of an instruction, either the total word (for word operations) or the low byte (for byte operations) of an SFR can be addressed via 'reg'. Note that the high byte of an SFR cannot be accessed via the 'reg' addressing mode. Short 'reg' addresses from F0<sub>H</sub> to FF<sub>H</sub> always specify GPRs. In that case, only the lower four bits of 'reg' are significant for physical address generation, and thus it can be regarded as being identical to the address generation described for the 'Rb' and 'Rw' addressing modes.
- bitoff:** Specifies direct access to any word in the bit-addressable memory space. 'bitoff' requires eight bits in the instruction format. Depending on the specified 'bitoff' range, different base addresses are used to generate physical addresses: Short 'bitoff' addresses from 00<sub>H</sub> to 7F<sub>H</sub> use 00'FD00<sub>H</sub> as a base address, and thus they specify the 128 highest internal RAM word locations (00'FD00<sub>H</sub>h to 00'FDFE<sub>H</sub>). Short 'bitoff' addresses from 80<sub>H</sub> to EF<sub>H</sub> use 00'FF00<sub>H</sub> as a base address to specify the highest internal SFR word locations (00'FF00<sub>H</sub> to 00'FFDE<sub>H</sub>) or use 00'F100<sub>H</sub> as a base address to specify the highest internal ESFR word locations (00'F100<sub>H</sub> to 00'F1DE<sub>H</sub>). 'bitoff' accesses to the ESFR area require a preceding EXT\*R instruction to switch the base address (not available in the SAB 8XC166(W) devices). For short 'bitoff' addresses from F0<sub>H</sub> to FF<sub>H</sub>, only the lowest four bits and the contents of the CP register are used to generate the physical address of the selected word GPR.
- bitaddr:** Any bit address is specified by a word address within the bit-addressable memory space (see 'bitoff'), and by a bit position ('bitpos') within that word. Thus, 'bitaddr' requires twelve bits in the instruction format.

### Long Addressing Mode

This addressing mode uses one of the four DPP registers to specify a physical 18-bit or 24-bit address. Any word or byte data within the entire address space can be accessed with this mode. The C167/5 devices also support an override mechanism for the DPP addressing scheme.

**Note:** Word accesses on odd byte addresses are not executed, but rather trigger a hardware trap. After reset, the DPP registers are initialized in a way that all long addresses are directly mapped onto the identical physical addresses.

Any long 16-bit address consists of two portions, which are interpreted in different ways. Bits 13...0 specify a 14-bit data page offset, while bits 15...14 specify the Data Page Pointer (1 of 4), which is to be used to generate the physical 18-bit or 24-bit address (see figure below).

**Figure 6-1:** Interpretation of a 16-bit Long Address

The SAB 8XC166(W) devices support an address space of up to 256 KByte, while the C167/5 devices support an address space of up to 16 MByte, so only the lower two or ten bits (respectively) of the selected DPP register content are concatenated with the 14-bit data page offset to build the physical address.

The long addressing mode is referred to by the mnemonic 'mem'.

Mnemonic	Physical Address	Long Address Range	Scope of Access
mem	(DPP0)    mem^3FFF <sub>H</sub>	0000 <sub>H</sub> ...3FFF <sub>H</sub>	Any Word or Byte
	(DPP1)    mem^3FFF <sub>H</sub>	4000 <sub>H</sub> ...7FFF <sub>H</sub>	
	(DPP2)    mem^3FFF <sub>H</sub>	8000 <sub>H</sub> ...BFFF <sub>H</sub>	
	(DPP3)    mem^3FFF <sub>H</sub>	C000 <sub>H</sub> ...FFFF <sub>H</sub>	
mem	pag    mem^3FFF <sub>H</sub>	0000 <sub>H</sub> ...FFFF <sub>H</sub> (14-bit)	Any Word or Byte
mem	seg    mem	0000 <sub>H</sub> ...FFFF <sub>H</sub> (16-bit)	Any Word or Byte

### DPP Override Mechanism in the C167/5

Other than the older devices from the SAB 80C166 group the C167 and C165 devices provide an override mechanism that allows to bypass the DPP addressing scheme temporarily.

The EXTP(R) and EXT(S) instructions override this addressing mechanism. Instruction EXTP(R) replaces the content of the respective DPP register, while instruction EXT(S) concatenates the complete 16-bit long address with the specified segment base address. The overriding page or segment may be specified directly as a constant (#pag, #seg) or via a word GPR (Rw).

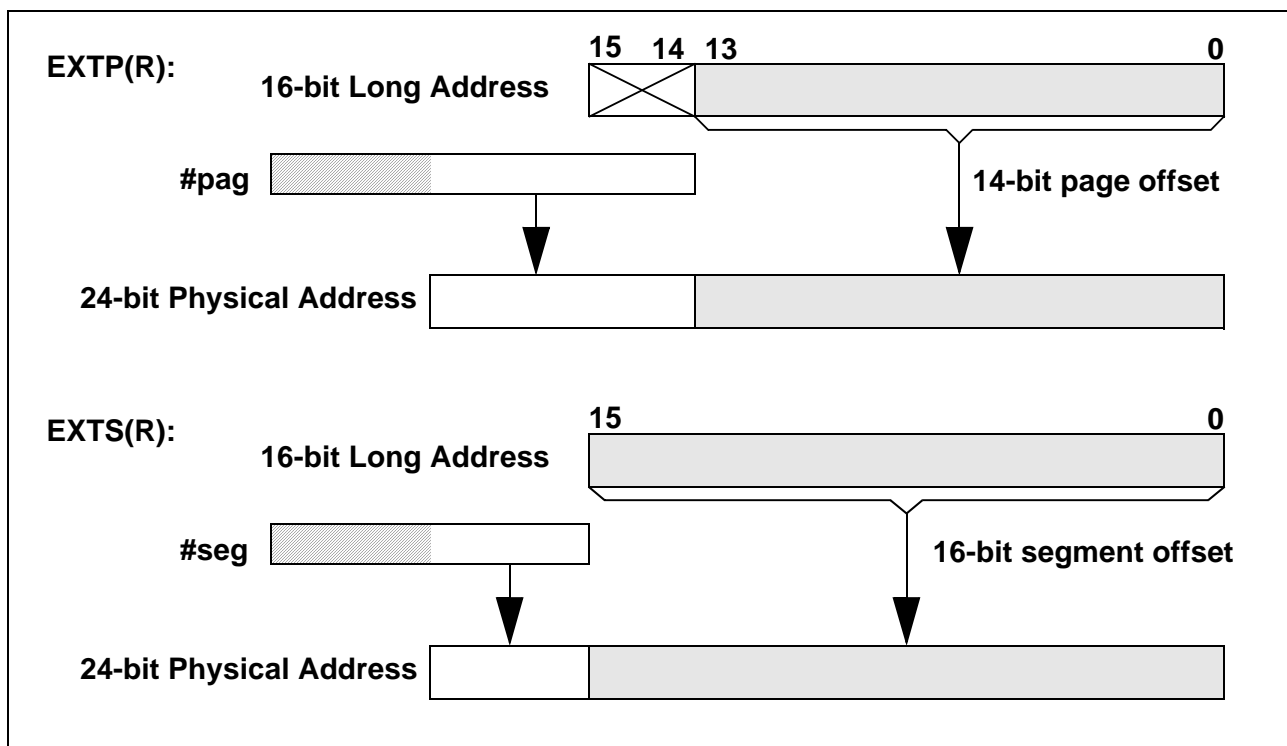

Figure 6-2: Overriding the DPP Mechanism

### Indirect Addressing Modes

These addressing modes can be regarded as a combination of short and long addressing modes. This means that long 16-bit addresses are specified indirectly by the contents of a word GPR, which is specified directly by a short 4-bit address ('Rw'=0 to 15). There are indirect addressing modes, which add a constant value to the GPR contents before the long 16-bit address is calculated. Other indirect addressing modes allow decrementing or incrementing the indirect address pointers (GPR content) by 2 or 1 (referring to words or bytes).

In each case, one of the four DPP registers is used to specify physical 18-bit or 24-bit addresses. Any word or byte data within the entire memory space can be addressed indirectly.

**Note:** The exceptions for instructions EXTP(R) and EXT(S), ie. overriding the DPP mechanism, apply in the same way as described for the long addressing modes.

Some instructions only use the lowest four word GPRs (R3...R0) as indirect address pointers, which are specified via short 2-bit addresses in that case.

**Note:** Word accesses on odd byte addresses are not executed, but rather trigger a hardware trap. After reset, the DPP registers are initialized in a way that all indirect long addresses are directly mapped onto the identical physical addresses.

Physical addresses are generated from indirect address pointers via the following algorithm:

- 1) Calculate the physical address of the word GPR, which is used as indirect address pointer, using the specified short address ('Rw') and the current register bank base address (CP).

$$\text{GPR Address} = (\text{CP}) + 2 * \text{Short Address}$$

- 2) Pre-decremented indirect address pointers ('-Rw') are decremented by a data-type-dependent value ( $\Delta=1$  for byte operations,  $\Delta=2$  for word operations), before the long 16-bit address is generated:

$$(\text{GPR Address}) = (\text{GPR Address}) - \Delta ; [\text{optional step!}]$$

- 3) Calculate the long 16-bit address by adding a constant value (if selected) to the content of the indirect address pointer:

$$\text{Long Address} = (\text{GPR Pointer}) + \text{Constant}$$

- 4) Calculate the physical 18-bit or 24-bit address using the resulting long address and the corresponding DPP register content (see long 'mem' addressing modes).

$$\text{Physical Address} = (\text{DPPi}) + \text{Page offset}$$

- 5) Post-Incremented indirect address pointers ('Rw+') are incremented by a data-type-dependent value ( $\Delta=1$  for byte operations,  $\Delta=2$  for word operations):

$$(\text{GPR Pointer}) = (\text{GPR Pointer}) + \Delta ; [\text{optional step!}]$$

The following indirect addressing modes are provided:

Mnemonic	Particularities
[Rw]	Most instructions accept any GPR (R15...R0) as indirect address pointer. Some instructions, however, only accept the lower four GPRs (R3...R0).
[Rw+]	The specified indirect address pointer is automatically post-incremented by 2 or 1 (for word or byte data operations) after the access.
[-Rw]	The specified indirect address pointer is automatically pre-decremented by 2 or 1 (for word or byte data operations) before the access.
[Rw+#data16]	The specified 16-bit constant is added to the indirect address pointer, before the long address is calculated.

### Constants

The C166 Family instruction set also supports the use of wordwide or bytewise immediate constants. For an optimum utilization of the available code storage, these constants are represented in the instruction formats by either 3, 4, 8 or 16 bits. Thus, short constants are always zero-extended while long constants are truncated if necessary to match the data format required for the particular operation (see table below):

Mnemonic	Word Operation	Byte Operation
#data3	0000 <sub>H</sub> + data3	00 <sub>H</sub> + data3
#data4	0000 <sub>H</sub> + data4	00 <sub>H</sub> + data4
#data8	0000 <sub>H</sub> + data8	data8
#data16	data16	data16 $\wedge$ FF <sub>H</sub>
#mask	0000 <sub>H</sub> + mask	mask

**Note:** Immediate constants are always signified by a leading number sign '#'.

### Instruction Range (#irang2)

The effect of the ATOMIC and EXTENDED instructions can be defined for the following 1...4 instructions. This instruction range (1...4) is coded in the 2-bit constant #irang2 and is represented by the values 0...3.

### Branch Target Addressing Modes

Different addressing modes are provided to specify the target address and segment of jump or call instructions. Relative, absolute and indirect modes can be used to update the Instruction Pointer register (IP), while the Code Segment Pointer register (CSP) can only be updated with an absolute value. A special mode is provided to address the interrupt and trap jump vector table, which resides in the lowest portion of code segment 0.

Mnemonic	Target Address	Target Segment	Valid Address Range
caddr	(IP) = caddr	-	caddr = 0000 <sub>H</sub> ...FFFE <sub>H</sub>
rel	(IP) = (IP) + 2*rel (IP) = (IP) + 2*( $\overline{\text{rel}}$ +1)	- -	rel = 00 <sub>H</sub> ...7F <sub>H</sub> rel = 80 <sub>H</sub> ...FF <sub>H</sub>
[Rw]	(IP) = ((CP) + 2*Rw)	-	Rw = 0...15
seg	-	(CSP) = seg	seg = 0...255(3)
#trap7	(IP) = 0000 <sub>H</sub> + 4*trap7	(CSP) = 0000 <sub>H</sub>	trap7 = 00 <sub>H</sub> ...7F <sub>H</sub>

- caddr:** Specifies an absolute 16-bit code address within the current segment. Branches MAY NOT be taken to odd code addresses. Therefore, the least significant bit of 'caddr' must always contain a '0', otherwise a hardware trap would occur.
- rel:** This mnemonic represents an 8-bit signed word offset address relative to the current Instruction Pointer contents, which points to the instruction after the branch instruction. Depending on the offset address range, either forward ('rel'= 00<sub>H</sub> to 7F<sub>H</sub>) or backward ('rel'= 80<sub>H</sub> to FF<sub>H</sub>) branches are possible. The branch instruction itself is repeatedly executed, when 'rel' = '-1' (FF<sub>H</sub>) for a word-sized branch instruction, or 'rel' = '-2' (FE<sub>H</sub>) for a double-word-sized branch instruction.
- [Rw]:** In this case, the 16-bit branch target instruction address is determined indirectly by the content of a word GPR. In contrast to indirect data addresses, indirectly specified code addresses are NOT calculated via additional pointer registers (eg. DPP registers). Branches MAY NOT be taken to odd code addresses. Therefore, the least significant bit of the address pointer GPR must always contain a '0', otherwise a hardware trap would occur.
- seg:** Specifies an absolute code segment number. The devices of the SAB 80C166 group support 4 different code segments, while the devices of the C167/5 group support 256 different code segments, so only the two or eight lower bits (respectively) of the 'seg' operand value are used for updating the CSP register.
- #trap7:** Specifies a particular interrupt or trap number for branching to the corresponding interrupt or trap service routine via a jump vector table. Trap numbers from 00<sub>H</sub> to 7F<sub>H</sub> can be specified, which allow to access any double word code location within the address range 00'0000<sub>H</sub>...00'01FC<sub>H</sub> in code segment 0 (ie. the interrupt jump vector table). For the association of trap numbers with the corresponding interrupt or trap sources please refer to chapter "Interrupt and Trap Functions".

### 7 Instruction State Times

Basically, the time to execute an instruction depends on where the instruction is fetched from, and where possible operands are read from or written to. The fastest processing mode is to execute a program fetched from the internal ROM. In that case most of the instructions can be processed within just one machine cycle, which is also the general minimum execution time.

All external memory accesses are performed by the on-chip External Bus Controller (EBC), which works in parallel with the CPU. Mostly, instructions from external memory cannot be processed as fast as instructions from the internal ROM, because some data transfers, which internally can be performed in parallel, have to be performed sequentially via the external interface. In contrast to internal ROM program execution, the time required to process an external program additionally depends on the length of the instructions and operands, on the selected bus mode, and on the duration of an external memory cycle, which is partly selectable by the user.

Processing a program from the internal RAM space is not as fast as execution from the internal ROM area, but it offers a lot of flexibility (ie. for loading temporary programs into the internal RAM via the chip's serial interface, or end-of-line programming via the bootstrap loader).

The following description allows evaluating the minimum and maximum program execution times. This will be sufficient for most requirements. For an exact determination of the instructions' state times it is recommended to use the facilities provided by simulators or emulators.

This section defines the subsequently used time units, summarizes the minimum (standard) state times of the 16-bit microcontroller instructions, and describes the exceptions from that standard timing.

#### Time Unit Definitions

The following time units are used to describe the instructions' processing times:

[ $f_{CPU}$ ]: CPU operating frequency (may vary from 1 MHz to 20 MHz).

[State]: One state time is specified by one CPU clock period. Henceforth, one State is used as the basic time unit, because it represents the shortest period of time which has to be considered for instruction timing evaluations.

$$\begin{aligned} 1 \text{ [State]} &= 1/f_{CPU} \quad [\text{s}] \quad ; \text{ for } f_{CPU} = \text{variable} \\ &= 50 \quad \quad \quad [\text{ns}] \quad ; \text{ for } f_{CPU} = 20 \text{ MHz} \end{aligned}$$

[ACT]: This ALE (Address Latch Enable) Cycle Time specifies the time required to perform one external memory access. One ALE Cycle Time consists of either two (for demultiplexed external bus modes) or three (for multiplexed external bus modes) state times plus a number of state times, which is determined by the number of waitstates programmed in the MCTC (Memory Cycle Time Control) and MTTC (Memory Tristate Time Control) bit fields of the SYSCON/BUSCONx registers.

In case of demultiplexed external bus modes:

$$\begin{aligned} 1 * \text{ACT} &= (2 + (15 - \text{MCTC}) + (1 - \text{MTTC})) * \text{States} \\ &= 100 \text{ ns} \dots 900 \text{ ns} \quad ; \text{ for } f_{CPU} = 20 \text{ MHz} \end{aligned}$$

In case of multiplexed external bus modes:

$$\begin{aligned} 1 * \text{ACT} &= 3 + (15 - \text{MCTC}) + (1 - \text{MTTC}) * \text{States} \\ &= 150 \text{ ns} \dots 950 \text{ ns} \quad ; \text{ for } f_{CPU} = 20 \text{ MHz} \end{aligned}$$

The total time ( $T_{tot}$ ), which a particular part of a program takes to be processed, can be calculated by the sum of the single instruction processing times ( $T_{In}$ ) of the considered instructions plus an offset value of 6 state times which considers the solitary filling of the pipeline, as follows:

$$T_{tot} = T_{I1} + T_{I2} + \dots + T_{In} + 6 * \text{States}$$

The time  $T_{In}$ , which a single instruction takes to be processed, consists of a minimum number ( $T_{Imin}$ ) plus an additional number ( $T_{Iadd}$ ) of instruction state times and/or ALE Cycle Times, as follows:

$$T_{In} = T_{Imin} + T_{Iadd}$$

### Minimum State Times

The table below shows the minimum number of state times required to process an instruction fetched from the internal ROM ( $T_{Imin}$  (ROM)). The minimum number of state times for instructions fetched from the internal RAM ( $T_{Imin}$  (RAM)), or of ALE Cycle Times for instructions fetched from the external memory ( $T_{Imin}$  (ext)), can also be easily calculated by means of this table.

Most of the 16-bit microcontroller instructions - except some of the branches, the multiplication, the division and a special move instruction - require a minimum of two state times. In case of internal ROM program execution there is no execution time dependency on the instruction length except for some special branch situations. The injected target instruction of a cache jump instruction can be considered for timing evaluations as if being executed from the internal ROM, regardless of which memory area the rest of the current program is really fetched from.

For some of the branch instructions the table below represents both the standard number of state times (ie. the corresponding branch is taken) and an additional  $T_{Imin}$  value in parentheses, which refers to the case that either the branch condition is not met or a cache jump is taken.

### Minimum Instruction State Times [Unit = ns]

Instruction	$T_{Imin}$ (ROM) [States]	$T_{Imin}$ (ROM) (@ 20 MHz CPU clock)
CALLI, CALLA	4 (+2)	200 (+100)
CALLS, CALLR, PCALL	4	200
JB, JBC, JNB, JNBS	4 (+2)	200 (+100)
JMPS	4	200
JMPA, JMPI, JMPR	4 (+2)	200 (+100)
MUL, MULU	10	500
DIV, DIVL, DIVU, DIVLU	20	1000
MOV[B] Rn, [Rm+#data16]	4	200
RET, RETI, RETP, RETS	4	200
TRAP	4	200
All other instructions	2	100

Instructions executed from the internal RAM require the same minimum time as if being fetched from the internal ROM plus an instruction-length dependent number of state times, as follows:

For 2-byte instructions:  $T_{Imin}(RAM) = T_{Imin}(ROM) + 4 * States$

For 4-byte instructions:  $T_{Imin}(RAM) = T_{Imin}(ROM) + 6 * States$

In contrast to the internal ROM program execution, the minimum time  $T_{Imin}(ext)$  to process an external instruction additionally depends on the instruction length.  $T_{Imin}(ext)$  is either 1 ALE Cycle Time for most of the 2-byte instructions, or 2 ALE Cycle Times for most of the 4-byte instructions. The following formula represents the minimum execution time of instructions fetched from an external memory via a 16-bit wide data bus:

For 2-byte instructions:  $T_{Imin}(ext) = 1 * ACT + (T_{Imin}(ROM) - 2) * States$

For 4-byte instructions:  $T_{Imin}(ext) = 2 * ACTs + (T_{Imin}(ROM) - 2) * States$

**Note:** For instructions fetched from an external memory via an 8-bit wide data bus, the minimum number of required ALE Cycle Times is twice the number for a 16-bit wide bus.

### Additional State Times

Some operand accesses can extend the execution time of an instruction  $T_{In}$ . Since the additional time  $T_{Iadd}$  is mostly caused by internal instruction pipelining, it often will be possible to evade these timing effects in time-critical program modules by means of a suitable rearrangement of the corresponding instruction sequences. Simulators and emulators offer a lot of facilities, which support the user in optimizing his program whenever required.

• **Internal ROM operand reads:**  $T_{Iadd} = 2 * States$

Both byte and word operand reads always require 2 additional state times.

• **Internal RAM operand reads via indirect addressing modes:**  $T_{Iadd} = 0$  or  $1 * State$

Reading a GPR or any other directly addressed operand within the internal RAM space does NOT cause additional state times. However, reading an indirectly addressed internal RAM operand will extend the processing time by 1 state time, if the preceding instruction auto-increments or auto-decrements a GPR as shown in the following example:

```

In          : MOV R1 , [R0+]          ; auto-increment R0
In+1       : MOV [R3], [R2]          ; if R2 points into the internal RAM space:
                                           ; TIadd = 1 * State
    
```

In this case, the additional time can simply be avoided by putting another suitable instruction before the instruction  $I_{n+1}$  indirectly reading the internal RAM.

• **Internal SFR operand reads:**  $T_{Iadd} = 0, 1 * \text{State}$  or  $2 * \text{States}$

Mostly, SFR read accesses do NOT require additional processing time. In some rare cases, however, either one or two additional state times will be caused by particular SFR operations, as follows:

– Reading an SFR immediately after an instruction, which writes to the internal SFR space, as shown in the following example:

```

In          : MOV  T0, #1000h      ; write to Timer 0
In+1        : ADD  R3, T1          ; read from Timer 1: TIadd = 1 * State
    
```

– Reading the PSW register immediately after an instruction, which implicitly updates the condition flags, as shown in the following example:

```

In          : ADD  R0, #1000h      ; implicit modification of PSW flags
In+1        : BAND C, Z           ; read from PSW: TIadd = 2 * States
    
```

– Implicitly incrementing or decrementing the SP register immediately after an instruction, which explicitly writes to the SP register, as shown in the following example:

```

In          : MOV  SP, #0FB00h     ; explicit update of the stack pointer
In+1        : SCXT R1, #1000h     ; implicit decrement of the stack pointer:
                                : TIadd = 2 * States
    
```

In these cases, the extra state times can be avoided by putting other suitable instructions before the instruction  $I_{n+1}$  reading the SFR.

• **External operand reads:**  $T_{Iadd} = 1 * \text{ACT}$

Any external operand reading via a 16-bit wide data bus requires one additional ALE Cycle Time. Reading word operands via an 8-bit wide data bus takes twice as much time (2 ALE Cycle Times) as the reading of byte operands.

• **External operand writes:**  $T_{Iadd} = 0 * \text{State} \dots 1 * \text{ACT}$

Writing an external operand via a 16-bit wide data bus takes one additional ALE Cycle Time. For timing calculations of external program parts, this extra time must always be considered. The value of  $T_{Iadd}$  which must be considered for timing evaluations of internal program parts, may fluctuate between 0 state times and 1 ALE Cycle Time. This is because external writes are normally performed in parallel to other CPU operations. Thus,  $T_{Iadd}$  could already have been considered in the standard processing time of another instruction. Writing a word operand via an 8-bit wide data bus requires twice as much time (2 ALE Cycle Times) as the writing of a byte operand.

• **Jumps into the internal ROM space:**  $T_{Iadd} = 0$  or  $2 * States$

The minimum time of 4 state times for standard jumps into the internal ROM space will be extended by 2 additional state times, if the branch target instruction is a double word instruction at a non-aligned double word location ( $xxx2_H$ ,  $xxx6_H$ ,  $xxxA_H$ ,  $xxxE_H$ ), as shown in the following example:

```
label      : ....                ; any non-aligned double word instruction
           : (eg. at location 0FFE_H)
....      : ....
In+1     : JMPA cc-UC, label      ; if a standard branch is taken:
           :  $T_{Iadd} = 2 * States$  ( $T_{In} = 6 * States$ )
```

A cache jump, which normally requires just 2 state times, will be extended by 2 additional state times, if both the cached jump target instruction and its successor instruction are non-aligned double word instructions, as shown in the following example:

```
label      : ....                ; any non-aligned double word instruction
           : (eg. at location 12FA_H)
It+1     : ....                ; any non-aligned double word instruction
           : (eg. at location 12FE_H)
In+1     : JMPR cc-UC, label      ; provided that a cache jump is taken:
           :  $T_{Iadd} = 2 * States$  ( $T_{In} = 4 * States$ )
```

If required, these extra state times can be avoided by allocating double word jump target instructions to aligned double word addresses ( $xxx0_H$ ,  $xxx4_H$ ,  $xxx8_H$ ,  $xxxC_H$ ).

• **Testing Branch Conditions:**  $T_{Iadd} = 0$  or  $1 * States$

Mostly, NO extra time is required for conditional branch instructions to decide whether a branch condition is met or not. However, an additional state time is required, if the preceding instruction writes to the PSW register, as shown in the following example:

```
In       : BSET USR0            ; write to PSW
In+1     : JMPR cc-Z, label      ; test condition flag in PSW:  $T_{Iadd} = 1 * State$ 
```

In this case, the extra state time can simply be intercepted by putting another suitable instruction before the conditional branch instruction.
